# PAMELA detectors

Main requirements → high-sensitivity antiparticle identification and precise momentum measure

GF:	21.5 cm <sup>2</sup> sr
Mass:	470 kg
Size:	130x70x70 cm <sup>3</sup>
Power Budget:	360W

# PAMELA detectors

Main requirements → high-sensitivity antiparticle identification and precise momentum measure

**Time-Of-Flight plastic scintillators + PMT**

- Trigger;
- Albedo rejection;
- Mass identification up to 1 GeV;
- Charge identification from  $dE/dX$ .

**Electromagnetic calorimeter W/Si sampling ( $16.3 X_0, 0.6 \lambda_I$ )**

- Discrimination  $e^+ / p, pbar/e^-$  (shower topology)
- Direct E measurement for  $e^-$

**Neutron detector & Shower-tail catcher (S4):**

- High-energy  $e/h$  discrimination

GF:	21.5 cm <sup>2</sup> sr
Mass:	470 kg
Size:	130x70x70 cm <sup>3</sup>
Power Budget:	360W

**Spectrometer microstrip silicon tracking system + permanent magnet**

- Magnetic rigidity ( $R = pc/Ze$ )
- Charge sign
- Charge value from  $dE/dx$

# Design Performance

- Antiprotons 80 MeV - 150 GeV
- Positrons 50 MeV – 270 GeV
- Electrons up to 400 GeV
- Protons up to 700 GeV
- Electrons+positrons up to 2 TeV  
(calorimeter alone)
- Light Nuclei (He/Be/C) up to 200 GeV/n
- AntiNuclei search sensitivity of  $3 \times 10^{-8}$  in  $\overline{\text{He}}/\text{He}$

- Simultaneous measurement of many cosmic-ray species
- New energy range
- Unprecedented statistics

# PAMELA: the integration

In

Data Receiv  
Station

- **PAMELA inside a pressurized container**
- **Moved from parking to data-taking position few times/year**

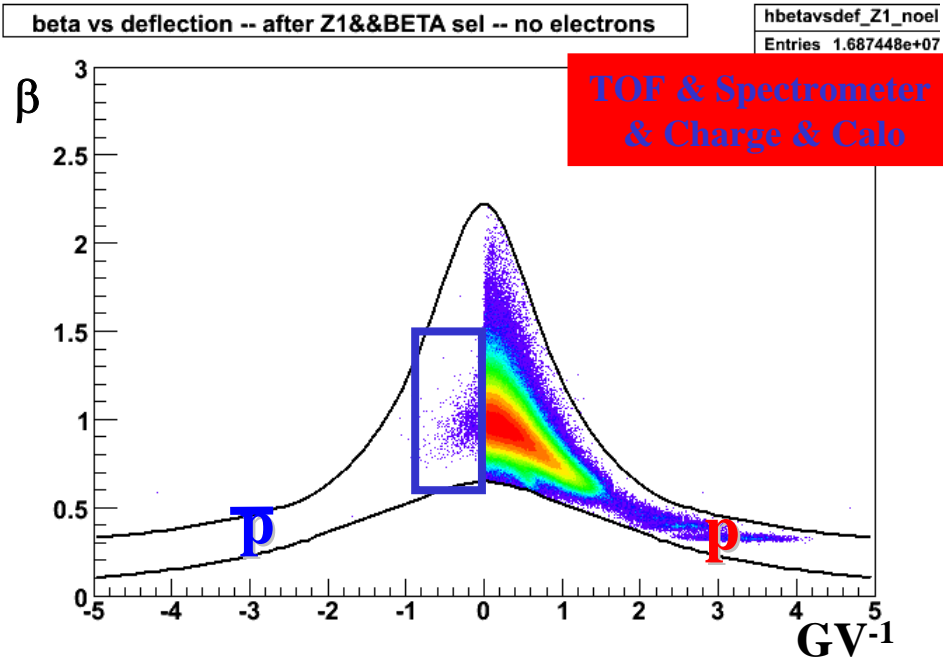

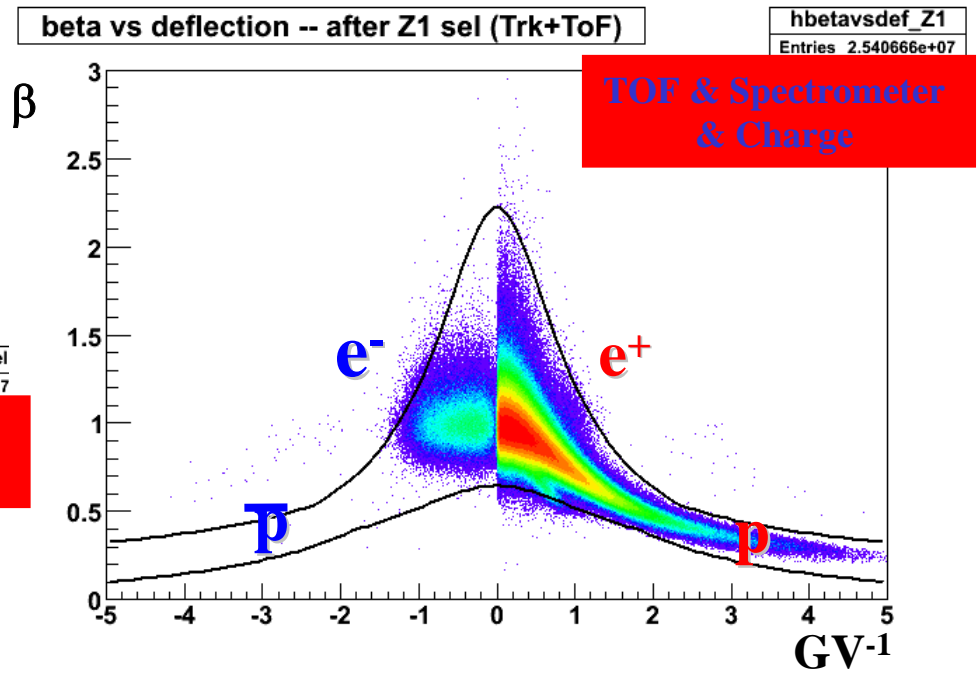

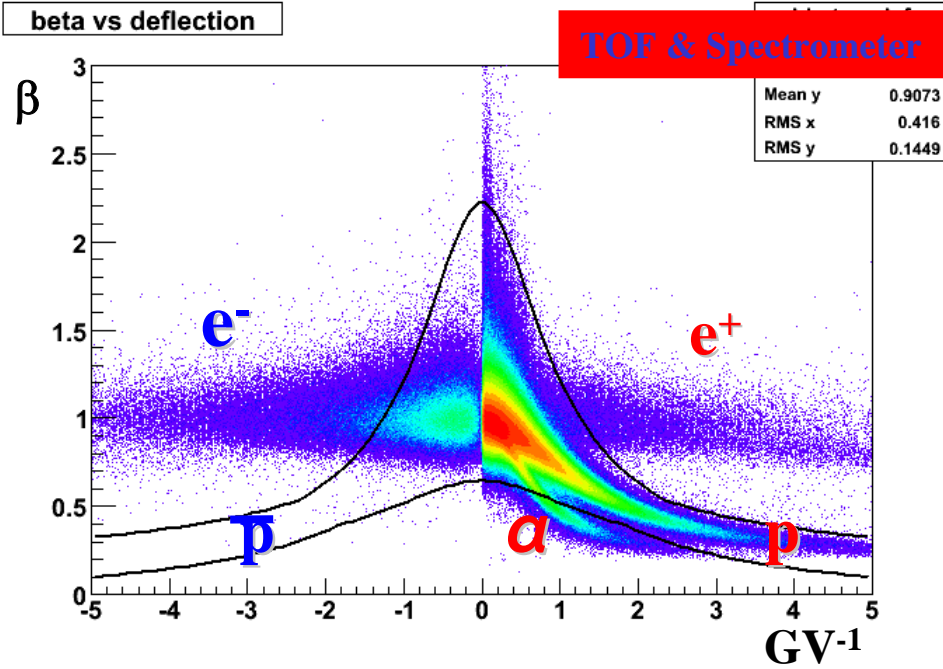

- Multi-spectral remote sensing of earth's surface
  - near-real-time high-quality images
- Built by the Space factory TsSKB Progress in Samara (Russia)
- Operational orbit parameters:
  - inclination  $\sim 70^\circ$
  - altitude  $\sim 360-600$  km (elliptical)
  - Active life  $>3$  years
- Data transmitted via Very high-speed Radio Link (VRL)

## the satellite & launch

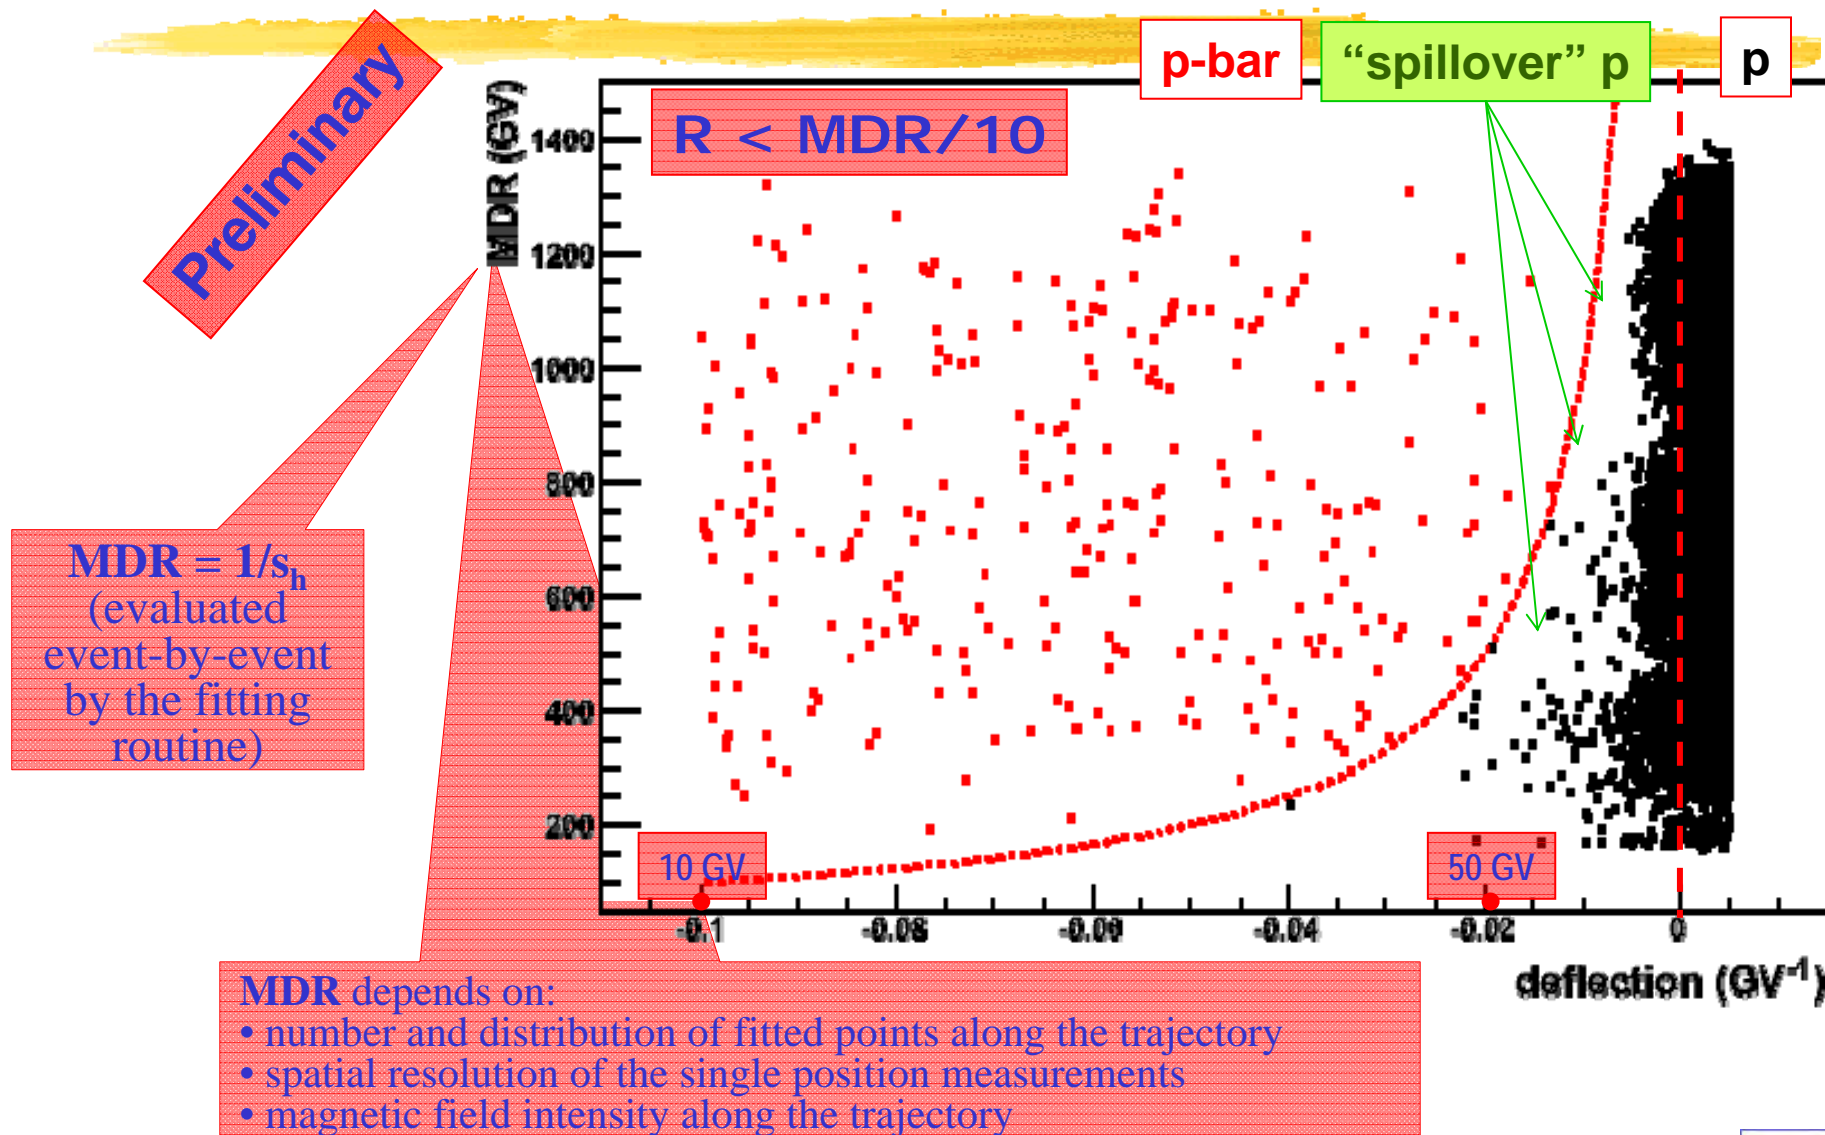

- Launch from Baikonur:  
June 15th 2006, 0800 UTC.  
Power On: June 21<sup>st</sup> 2006, 0300 UTC.  
Detectors operated as expected after launch
- PAMELA in continuous data-taking mode since commissioning phase ended on July 11<sup>th</sup> 2006
  - ~1200 days of data taking (~73% live-time)
  - ~14 TByte of raw data downlinked
  - $>1.4 \times 10^9$  triggers recorded and under analysis

# Positron selection with calorimeter

51 GV Positron

80GV Proton

Fraction of charge released along the calorimeter track

Energy (calo) –  
Momentum  
(spectrometer)  
match

F.S. Cafagna, ERICE 32n

# The “pre-sampler” method

## The electromagnetic calorimeter

### Characteristics:

- 44 Si layers (X/Y) + 22 W planes
- $16.3 X_0 / 0.6 I_0$
- 4224 channels
- Dynamic range 1400 mip
- Self-trigger mode ( $> 300 \text{ GeV GF} \sim 600 \text{ cm}^2 \text{ sr}$ )

### PROTON SELECTION

# The “pre-sampler” method

## The electromagnetic calorimeter

### Characteristics:

- 44 Si layers (X/Y) + 22 W planes
- $16.3 X_0 / 0.6 I_0$
- 4224 channels
- Dynamic range 1400 mip
- Self-trigger mode ( $> 300 \text{ GeV GF} \sim 600 \text{ cm}^2 \text{ sr}$ )

### POSITRON SELECTION

# $e^+$ background estimation from data

Fraction of charge released along the calorimeter track

Constrains on:

- Energy momentum match
- Shower starting-point

Rigidity: 20-28 GV

# Positron to All Electron Fraction

Adriani et al., *Astropart. Phys.* 34 (2010) 1 - arXiv:1001.3522

# DM ?

DM with  $M = 150$  GeV that annihilates into  $W^+W^-$

DM with  $M = 1$  TeV that annihilates into  $\mu^+\mu^-$

DM with  $M = 10$  TeV that annihilates into  $W^+W^-$

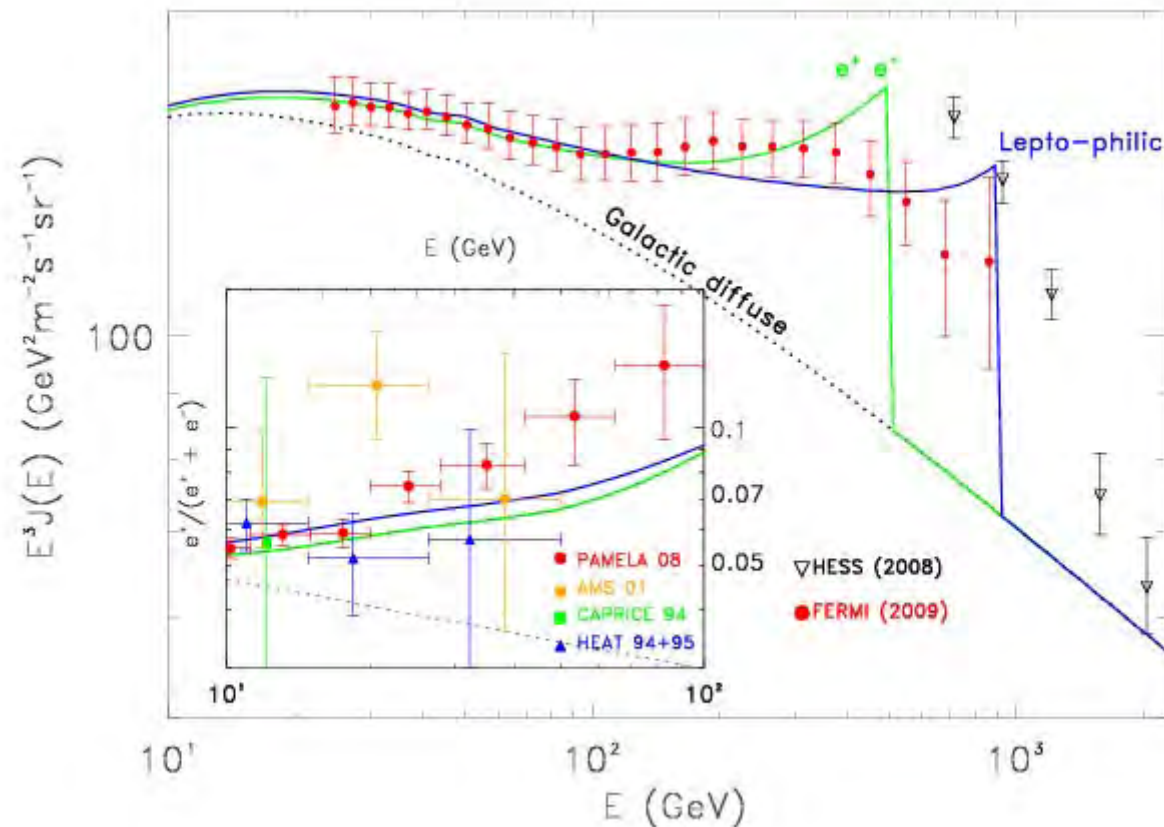

- PAMELA ability of measuring both proton and electron charge ration, make it possible to put several constrains to the models

M. Cirelli, M. Kadastik,  
M. Raidal, A. Strumia  
arXiv:0809.2409v3

Nuclear Astroph., Sep. 2010

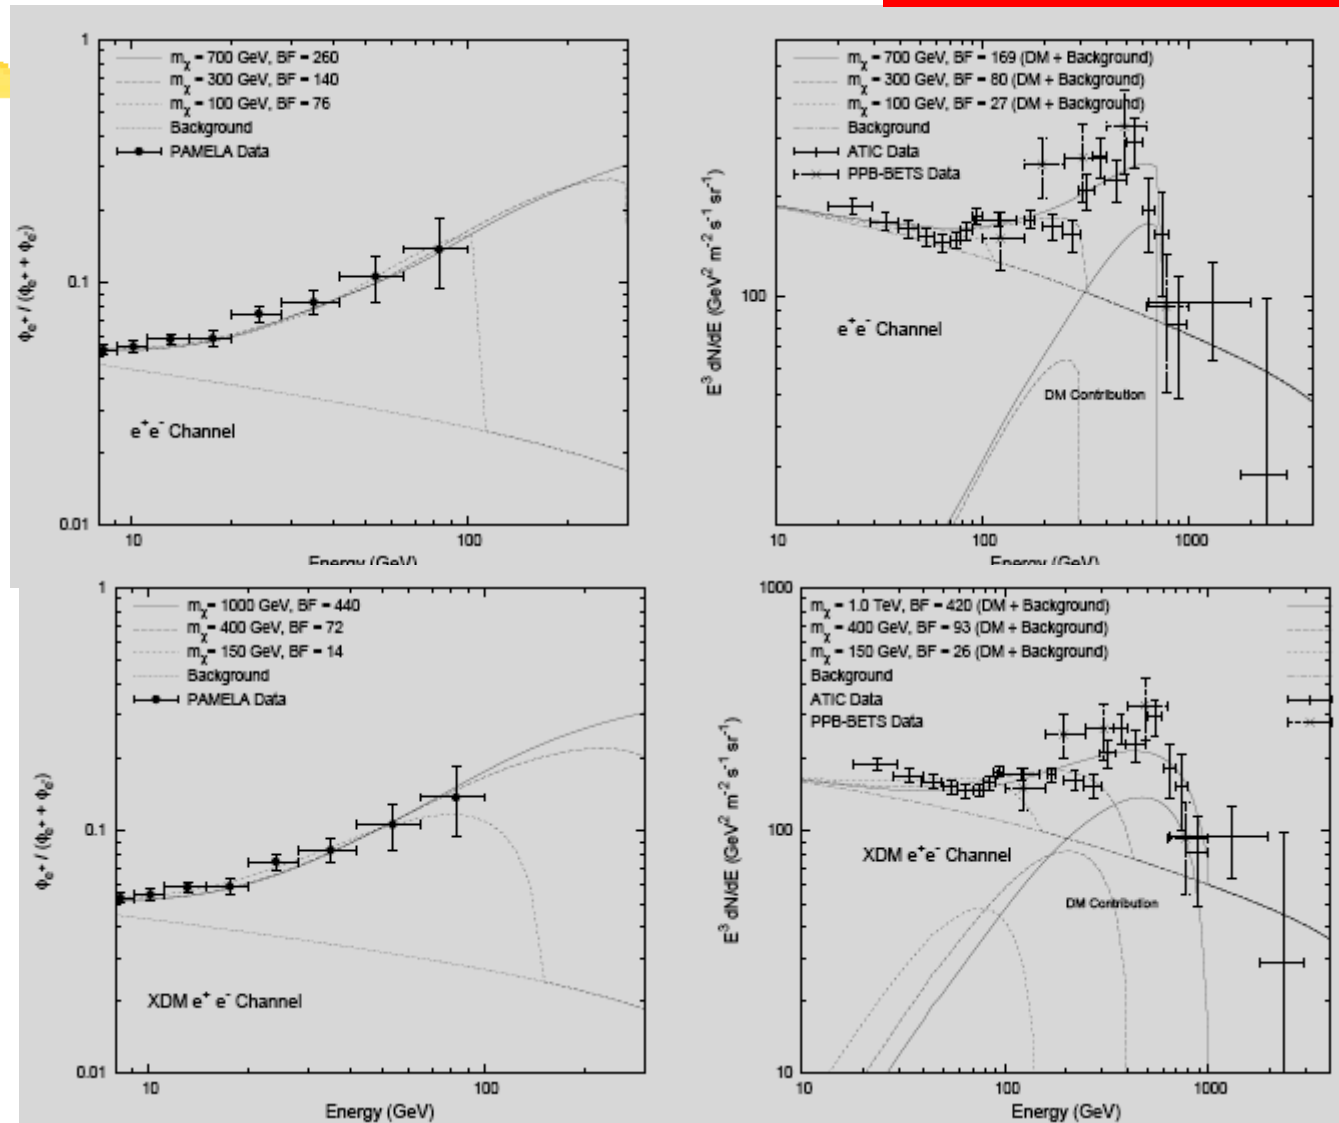

# Leptophilic DM

- DM only annihilates into charged leptons. DM masses between 0.4 and 2 TeV, but boost factors on the order of  $10^2$ .

D. Grasso *et al.* *Astrop. Phys.* 32 (2009), arXiv: 0905.0636v3

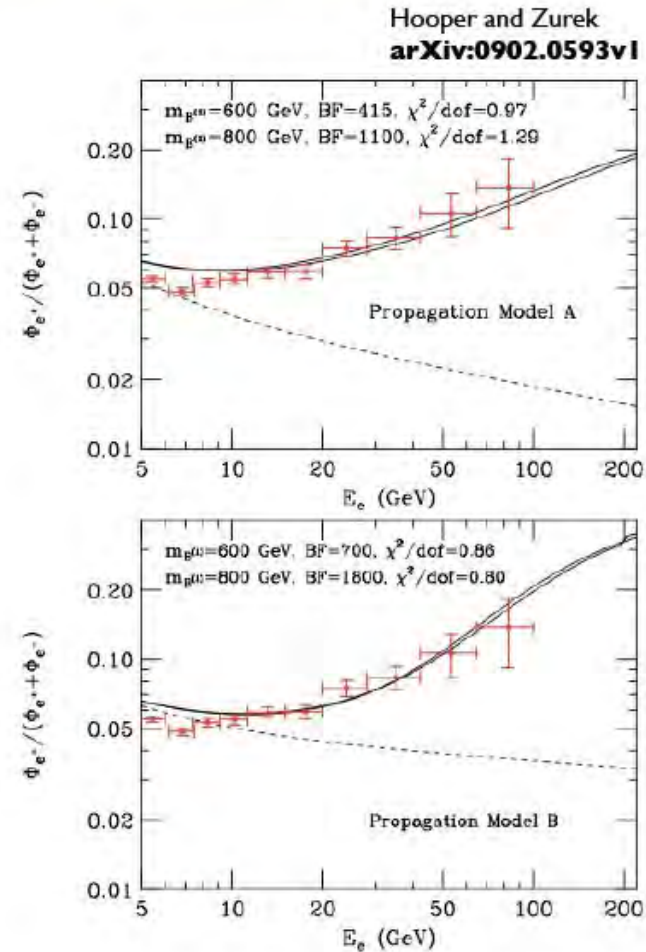

- Propose a new light boson ( $m_\Phi \leq \text{GeV}$ ), such that  $\chi\chi \rightarrow \Phi\Phi$ ;  $\Phi \rightarrow e^+e^-$ ,  $\mu^+\mu^-$ , ...
- Light boson, so decays to antiprotons are kinematically suppressed

# Example: Dark Matter

Majorana DM with **new** internal bremsstrahlung correction. NB: requires annihilation cross-section to be 'boosted' by  $>1000$ .

Kaluza-Klein dark matter

# Gamma constrains

Bertone, Cirelli, Strumia,  
Taoso 0811.3744

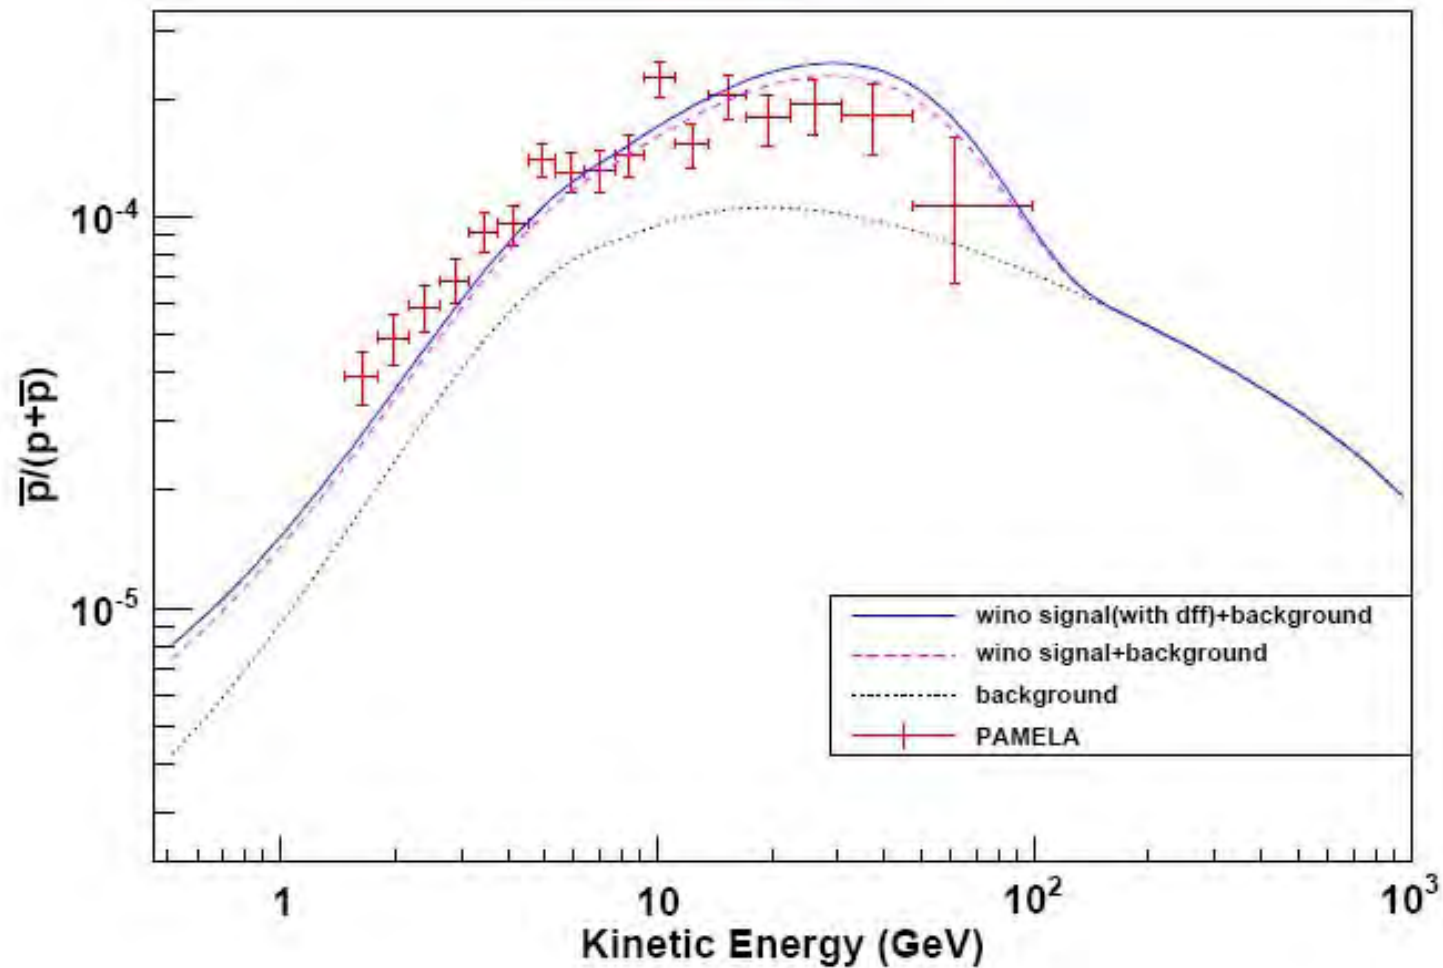

Cirelli, Panci, Serpico  
0912.0663

- Decaying DM excluded, leptonic annihilation with “fine-tuned” parameter

# Wino Dark Matter in a non-thermal Universe

G. Kane, R. Lu, and S. Watson  
arXiv:0906.4765v3 [astro-ph]

# Astrophysical Explanation Pulsars

*S. Profumo Astro-ph 0812-4457*

- Mechanism: the spinning  $\vec{B}$  of the pulsar strips  $e^-$  that accelerated at the polar cap or at the outer gap emit  $\gamma$  that make production of  $e^\pm$  that are trapped in the cloud, further accelerated and later released at  $\tau \sim 10^5$  years.
- Young ( $T \sim 10^5$  years) and nearby ( $< 1\text{kpc}$ ) If not: too much diffusion, low energy, too low flux.
- Geminga: 157 parsecs from Earth and 370,000 years old
- B0656+14: 290 parsecs from Earth and 110,000 years old
- Many others after Fermi/GLAST
- Diffuse mature pulsars

# Positrons from Pulsar

H. Yüksak et al., arXiv:0810.2784v2  
 Contributions of  $e^-$  &  $e^+$  from  
 Geminga assuming different distance,  
 age and energetic of the pulsar

Diffuse mature & nearby young pulsars Hooper,  
 Blasi, and Serpico arXiv:0810.1527

# Astrophysical Explanation: Pulsars

Young, nearby **pulsars**

**Not a new idea: Boulares, ApJ 342 (1989), Atoyan et al (1995)**

F.S. Cafagna, ERICE 32nd Course: Particle and Nuclear Astroph., Sep. 2010

# Astrophysical Explanation: Pulsars

- contribution of all nearby pulsars in the ATNF catalogue ( $\sim 150$  pulsars) with  $d < 3$  kpc with age  $5 \times 10^4 < T < 10^7$  yr

**D. Grasso *et al.* Astrop. Phys. 32 (2009), arXiv: 0905.0636v3**

# Antiprotons & positrons from old SNR's

P. Blasi Astro-ph.HE 0904.0871

P. Blasi 0903.2794

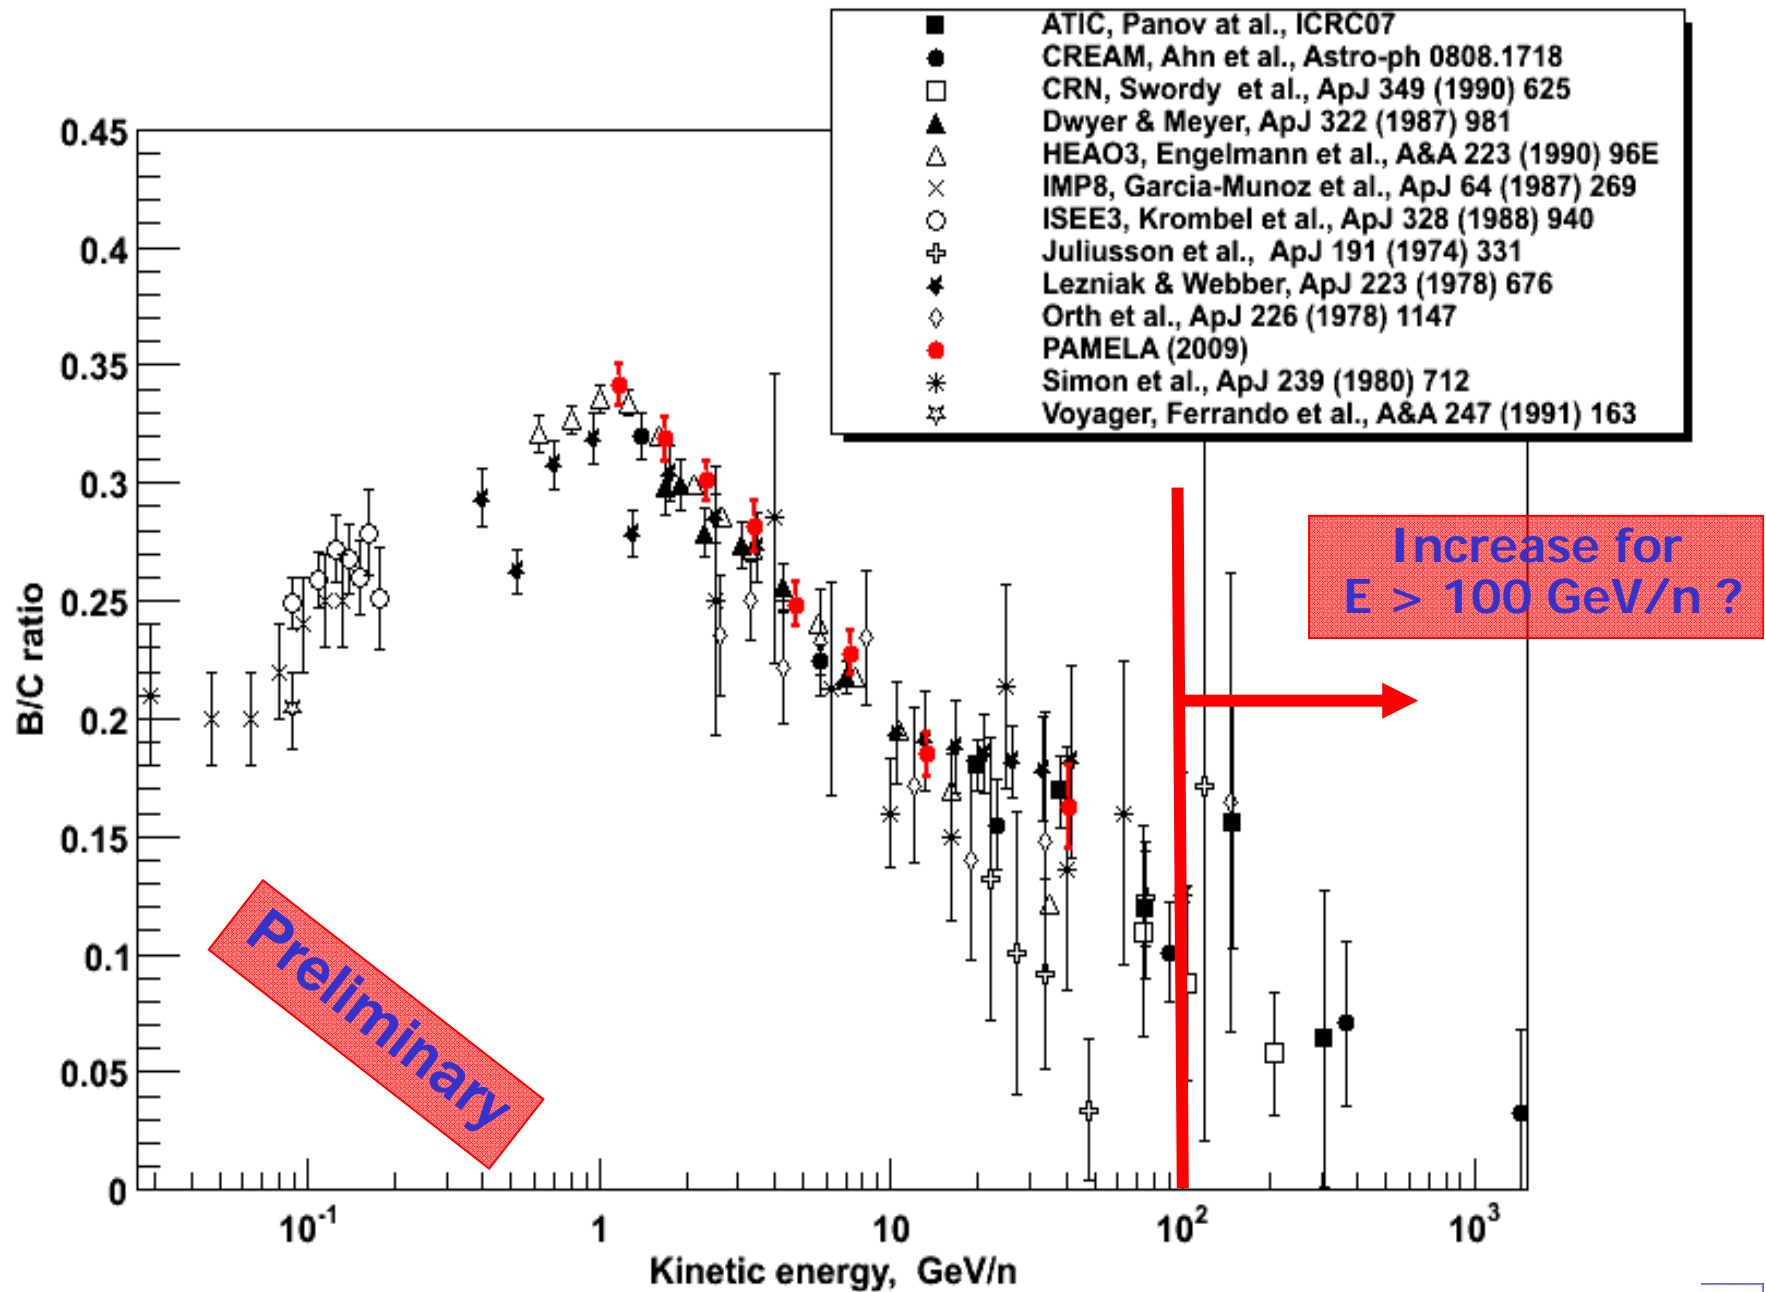

- positrons created as secondary products of hadronic interactions inside the sources
- secondary production takes place in the same region where cosmic rays are being accelerated
- Antiproton/proton and B/C increase for  $E > 100\text{GeV}$

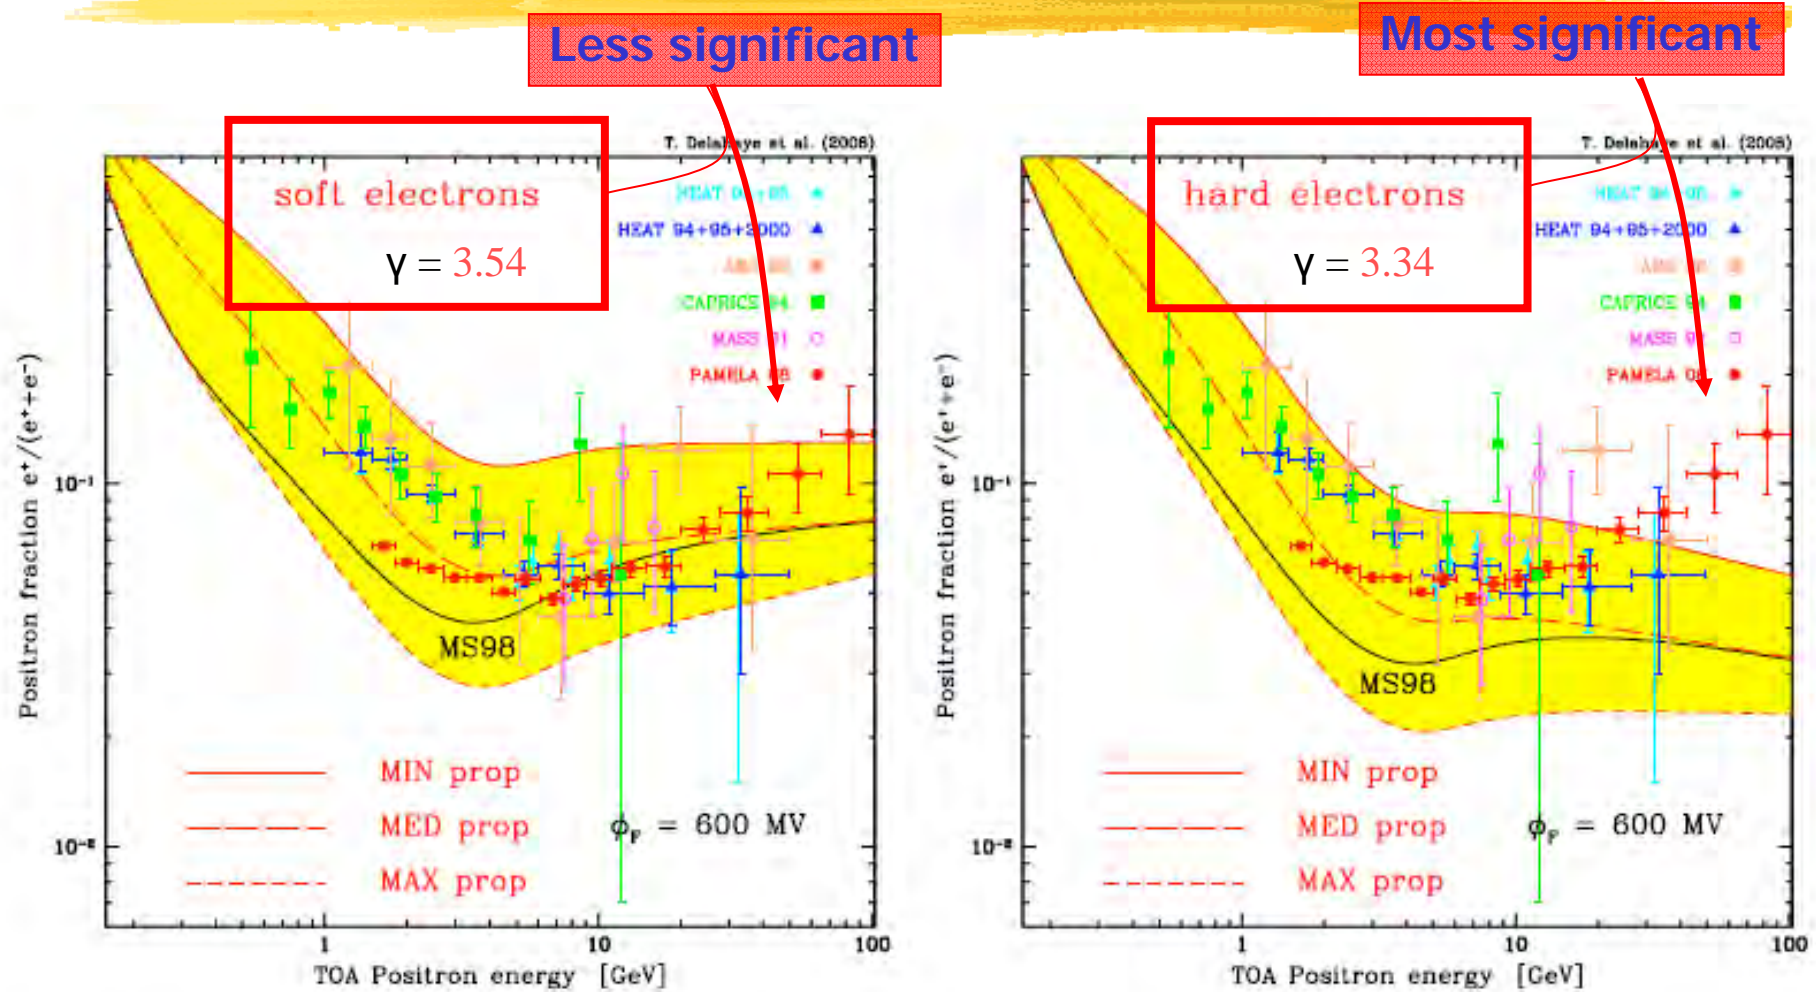

F.S. Cafagna, ERICE 32nd Course: Particle and Nuclear Astroph., Sep. 2010

# Conclusions

- We are entered in the new era of precision measurements of (anti)particle fluxes in CR.
- This opens new scenarios in indirect detection of DM but force us to improve our knowledge of the background investigating “standard” astrophysics.
- PAMELA data show anomalies only in the positron sector favoring a “leptophilic” DM but ...
- ... combined analysis of PAMELA, FERMI and HESS put strong constraints on that DM model.
- The knowledge of background and particle fluxes must be improved, stay tuned for new PAMELA data on  $e^\pm$ ,  $p$  &  $He$ ,  $B$  &  $C$  fluxes!

THANKS !!!!
