

# Monitoring of the KATRIN source composition by Raman spectroscopy

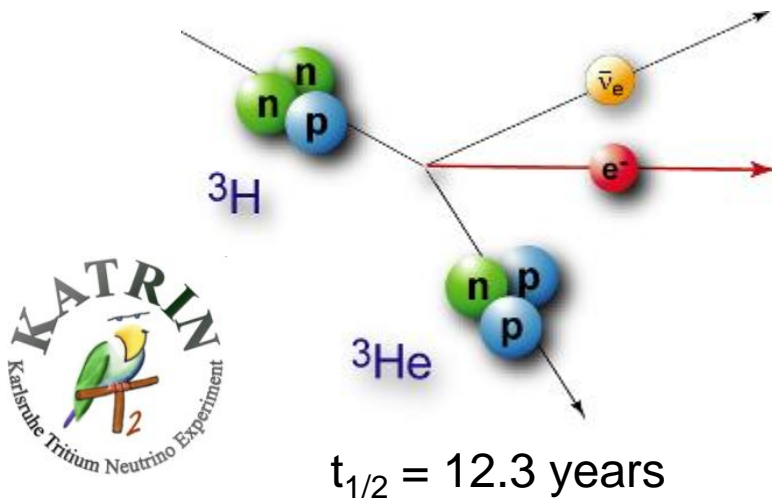

Sebastian Fischer

International school of nuclear physics - Neutrino Physics, Erice Sicily

INSTITUTE OF TECHNICAL PHYSICS, TRITIUM LABORATORY KARLSRUHE

# The KATRIN experiment

$$\frac{dN}{dt} \propto p \cdot (E + m_e) \cdot (E_0 - E) \cdot \sqrt{(E_0 - E)^2 - m_\nu^2}$$

$$m_\nu^2 = \sum_{i=1}^3 |U_{ei}|^2 m_i^2$$

**Determination of neutrino mass  
with 200 meV/c<sup>2</sup> sensitivity (90 % C.L.)**

# Windowless gaseous tritium source (WGTS)

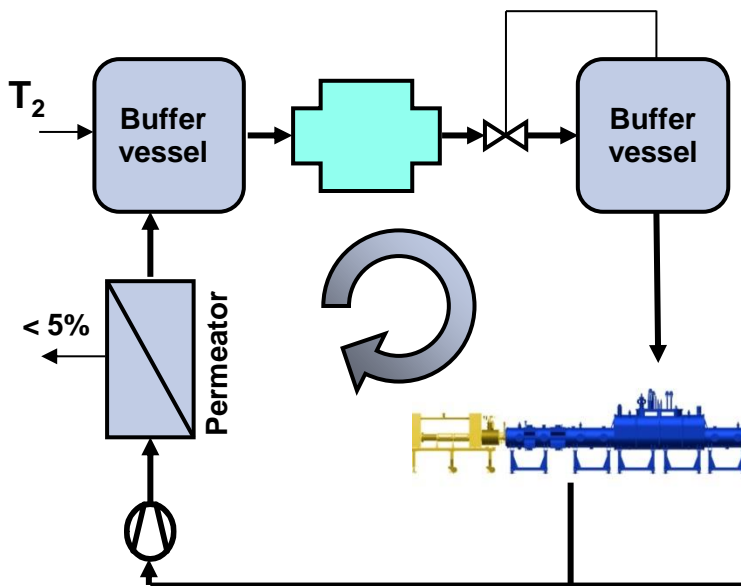

- Continuous gas injection and removal
- Steady-state gas column inside source tube

# Windowless gaseous tritium source (WGTS)

- Continuous gas injection and removal
- Steady-state gas column inside source tube

> 95% of tritium is kept inside  
 "Inner loop"  
 Complete TLK infrastructure needed

Tritium throughput: 40 g / day

# Control and monitoring of WGTS parameters

- Stability of WGTS is essential for  $m_\nu$  measurement
- Essential source parameters are stabilized to 0.1% level
- Dedicated control and monitoring systems developed

Monitoring of the operating parameters of the KATRIN Windowless Gaseous Tritium Source  
M. Babutzka et al., NJP 14 (2012) 103046

# Control and monitoring of WGTS parameters

- Stability of WGTS is essential for  $m_\nu$  measurement
- Essential source parameters are stabilized to 0.1% level

# Gas composition inside WGTS

3 hydrogen isotopes

Tritium

Deuterium

Hydrogen

6 hydrogen isotopologues

# Gas composition inside WGTS

3 hydrogen isotopes

Tritium

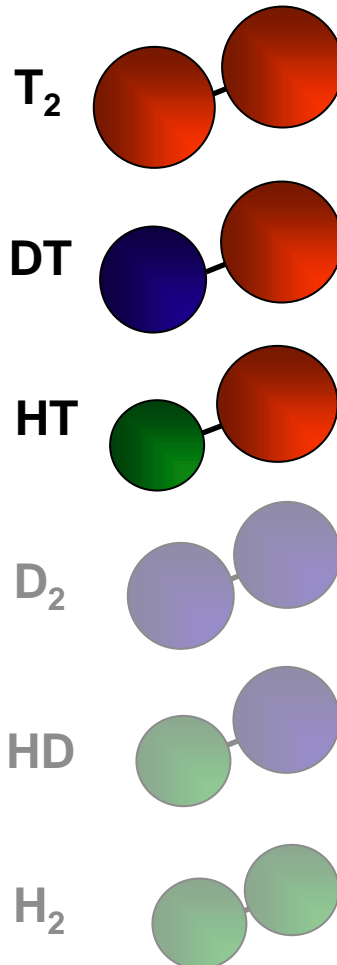

Deuterium

Hydrogen

6 hydrogen isotopologues

$> 91\% T_2$   
 $< 9\% DT$   
 $< 1\% D_2$

Tritium purity  
 $\epsilon_T > 95\%$

**$\beta$ -spectrum depends on gas composition**

# Molecular effects on $\beta$ spectrum

- Doppler broadening
- Electron scattering with molecules
- Nuclear recoil of daughter molecules (e.g.  $^3\text{HeT}^+$ )
- Final state distribution

$$\Delta E_{\text{Doppler}} \propto v_{\text{therm}} \propto \sqrt{\frac{R \cdot T}{m_{\text{mol}}}}$$

$$\Delta E_{\text{scat,elast}} \propto E_{e,\text{kin}} \cdot \frac{m_e}{m_{\text{mol}}}$$

$$E_{\text{rec}} \approx E_0 \cdot \frac{m_e}{m_{\text{mol}}}$$

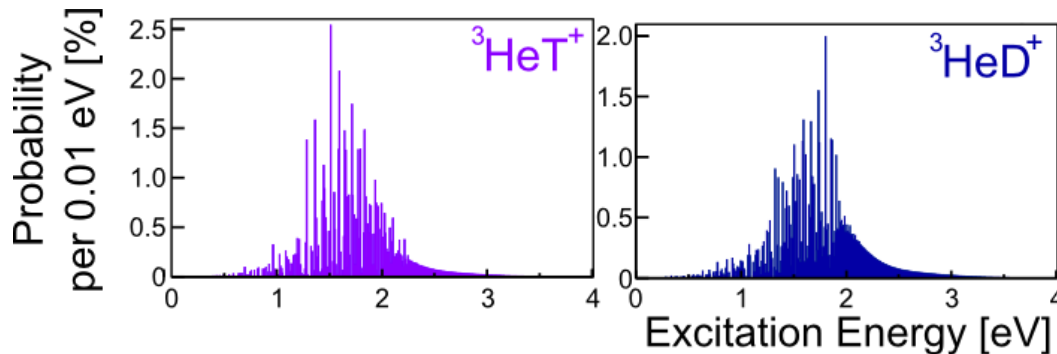

# Molecular effects on $\beta$ spectrum

- Doppler broadening
- Electron scattering with molecules
- Nuclear recoil of daughter molecules (e.g.  $^3\text{HeT}^+$ )
- Final state distribution

$$\Delta E_{\text{Doppler}} \propto v_{\text{therm}} \propto \sqrt{\frac{R \cdot T}{m_{\text{mol}}}}$$

$$\Delta E_{\text{scat,elast}} \propto E_{e,\text{kin}} \cdot \frac{m_e}{m_{\text{mol}}}$$

$$E_{\text{rec}} \approx E_0 \cdot \frac{m_e}{m_{\text{mol}}}$$

Continuous measurement of gas composition needed.

0.1% precision

< 10% accuracy

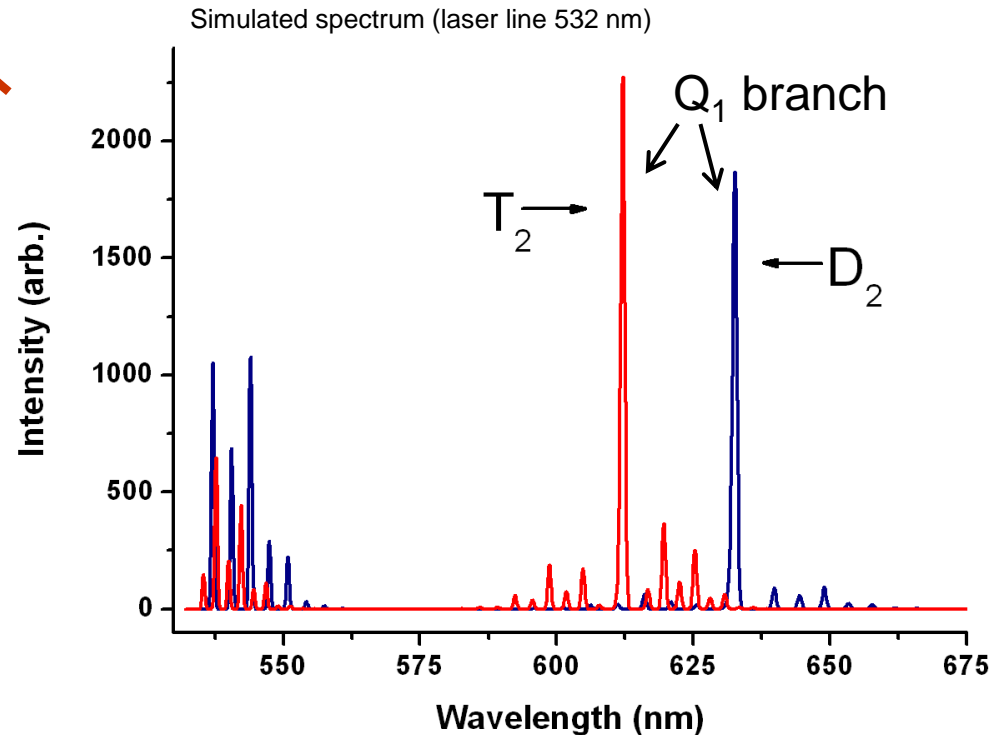

M. Schlösser et al., arXiv:1203.4099

# The Raman Effect

## Stokes Raman scattering

- Photon loses energy to molecule
- Excitation of molecule
- Change of wavelength

## Analysis

- Line position → Qualitative analysis
- Line intensity → Quantitative analysis

# Experimental setup

Swansea University  
Prifysgol Abertawe

# Experimental setup

Swansea University  
Prifysgol Abertawe

Laser Raman  
(LARA) cell

DPSS Nd:YAG laser  
(532nm,  $\leq 5W$ )

in 2009

# Long-term monitoring inside a test loop

- Non-stop monitoring for > 21 days

# Long-term monitoring inside a test loop

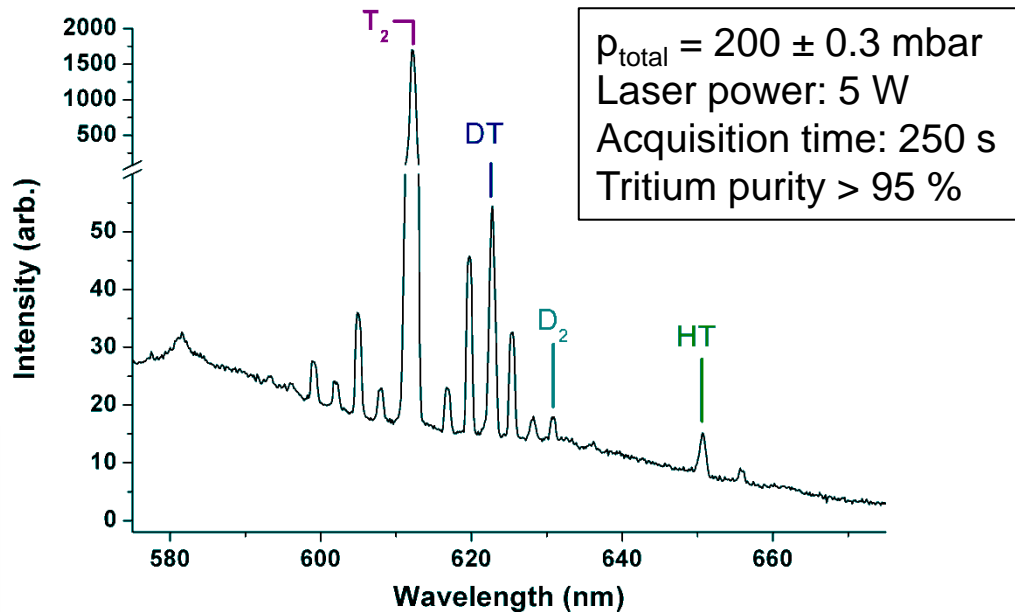

- Non-stop monitoring for > 21 days

S. F. et al, Fusion Sci Technol. 60 3, 925-930 (2011)

# Long-term monitoring inside a test loop

- Non-stop monitoring for > 21 days

Changes on the 0.1% level  
can be monitored

S. F. et al, Fusion Sci Technol. 60 3, 925-930 (2011)

# Long-term monitoring inside a test loop

## ■ Generation of impurities

First spectrum

Last spectrum (after > 21 days)

**Formation of tritiated methane species (from carbon in stainless steel)  
 Less prominent formation in inner loop expected (due to permeator)**

S. F. et al, Fusion Sci Technol. 60 3, 925-930 (2011)

# Everything done? Not yet

## Extraction of peak intensities

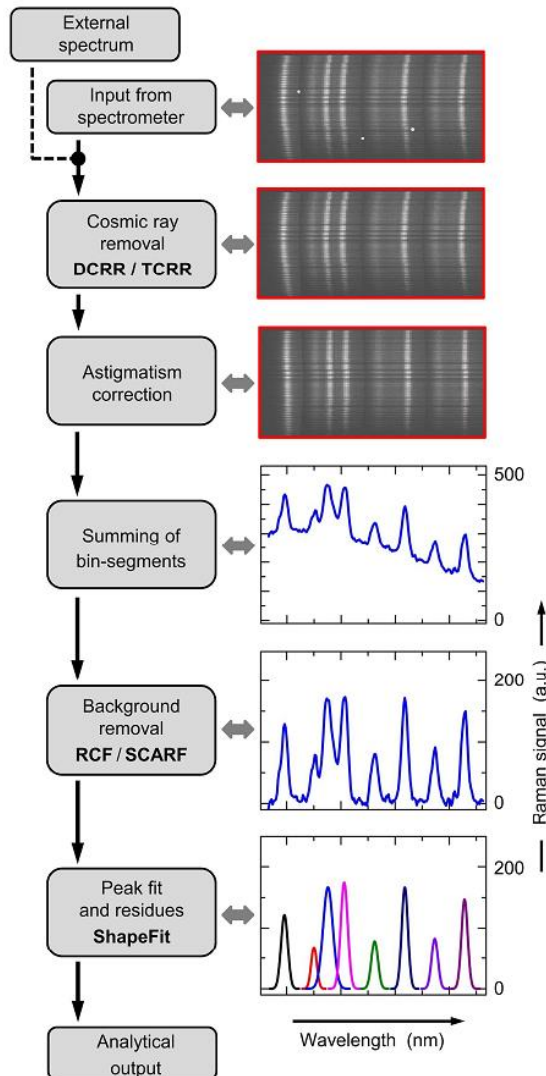

- Accurate, automated data analysis
- Conversion of peak intensities into concentration → Calibration

## Hardware

- Simplification of beam path
- Monitoring of system performance
- Tritium resistant optical coatings

# Data analysis: Accurate, robust and automated

## Development of analysis chain

- Fully documented and tested

T. M. James et al., Applied Spectroscopy 67 (8) 949 (2013)

- LabVIEW code available on

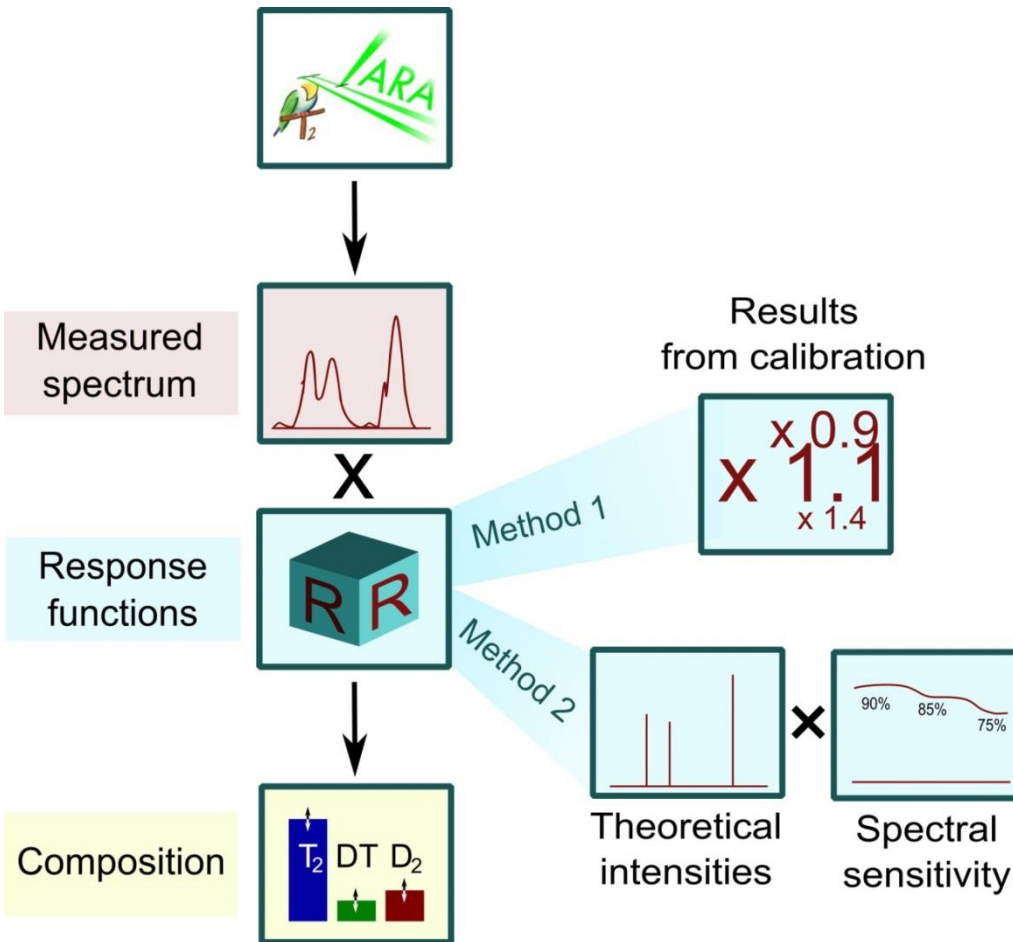

<http://spectools.sourceforge.net>

## Real time analysis implemented into data acquisition

## Validation

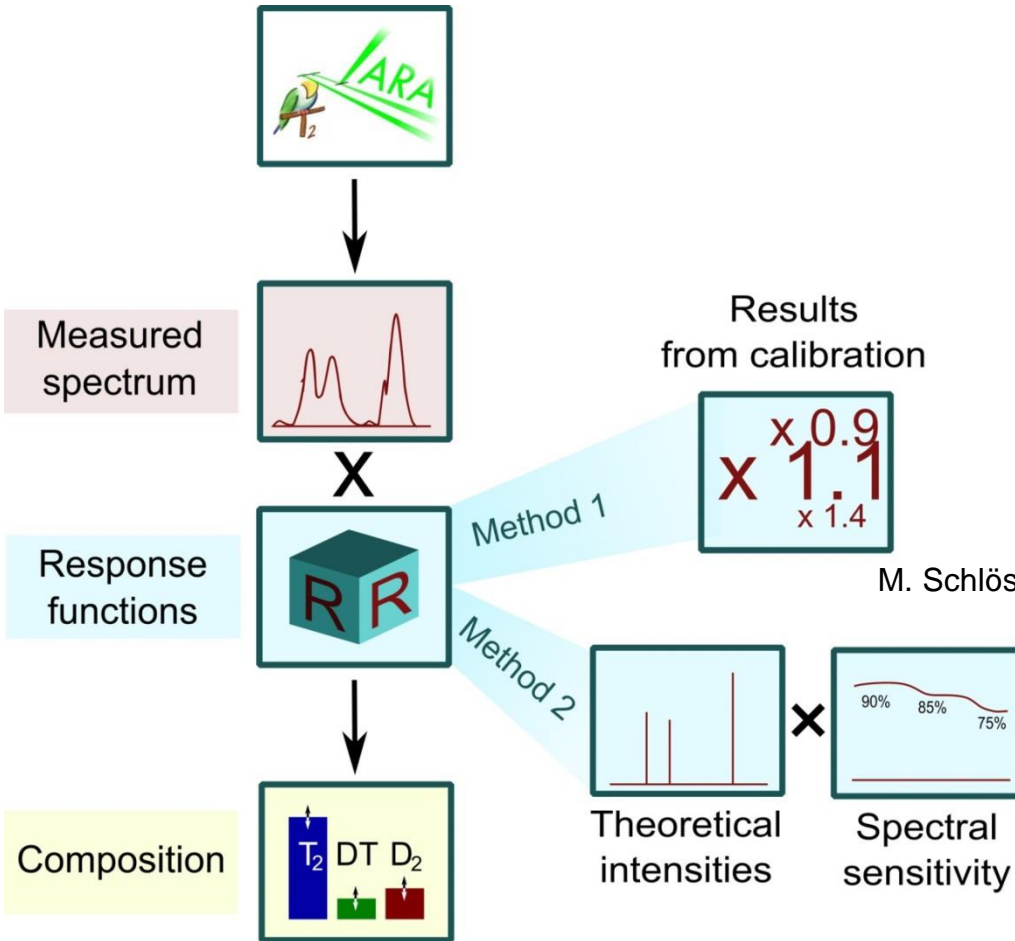

- Analysis of ambient air. Extraction of natural abundance of  $^{17}\text{O}$ ,  $^{18}\text{O}$ ,  $^{15}\text{N}$
- Application in calibration of LARA system

# Calibration

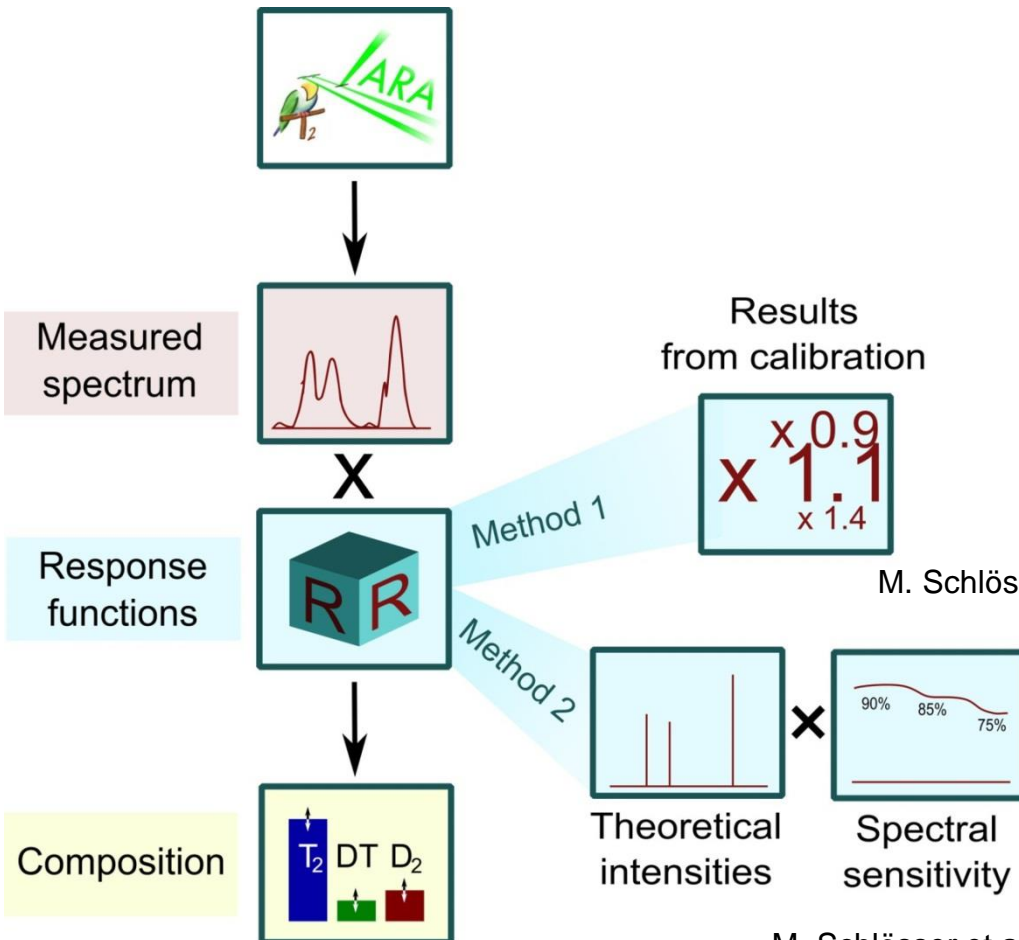

# Calibration

**Only possible for H<sub>2</sub>, HD, D<sub>2</sub>**  
**Calibration uncertainty < 2%**

M. Schlösser et al., Anal. Chem., 85 (5) 2739–2745 (2013)

# Calibration

**Only possible for H<sub>2</sub>, HD, D<sub>2</sub>**  
**Calibration uncertainty < 2%**

M. Schlösser et al., Anal. Chem., 85 (5) 2739–2745 (2013)

**Applicable to all isotopologues**  
**Validation of molecular constants within 3%**

M. Schlösser et al., J. Raman Spectrosc., 44 (6) 857-865 (2013)

# Coating degradation

- Anti-reflection coated windows (electron beam deposition)
- Degradation of coating on inner window surface after 3 months exposed to nominal tritium atmosphere ( $p = 200$  mbar)

**Damage not acceptable for long-term operation**

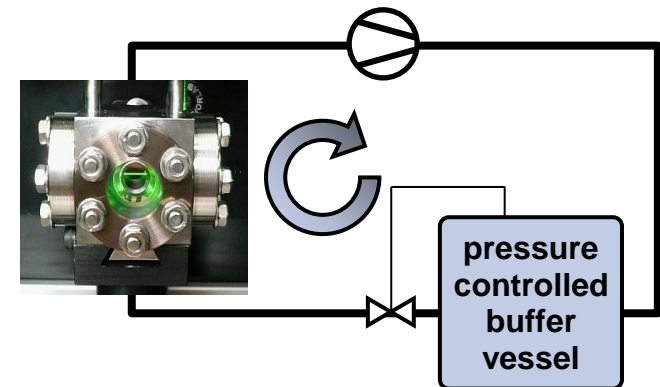

# (Potential) reasons for coating damage

- Radiation damage

Other cells were successfully operated with pure tritium → Radiation damage is unlikely

- Formation of hydrofluoric acid (TF)

Clark, Shanahan WSRC-STI-2006-00049 (2006)

# (Potential) reasons for coating damage

- Radiation damage

Other cells were successfully operated with pure tritium → Radiation damage is unlikely

- Formation of hydrofluoric acid (TF)

Clark, Shanahan WSRC-STI-2006-00049 (2006)

Valve with PTFE sealing

Discoloration of PTFE sealing  
→ Indication for TF formation

# Approaching the problem

- Long-term test without PTFE sealing valve

**Severe damage not reproduced**  
**Small spots appeared on inner surface**  
**→ No issue yet, but in future?**

- Test of commercially available coatings
  - Sputtering vs. Electron beam deposition
  - 4 manufacturing methods tested
  - Sputtered coatings are likely more resistant than electron beam deposited ones

**Spots on EBD coating**  
**Intrinsic weakness of EBD coating?**  
**No effects on sputtered coatings**

# (Probably) solving the problem

- Current interpretation
  - Severe damage was caused by HF formation
  - Spots observed in tests due to weakness of EBD coatings

# (Probably) solving the problem

- Current interpretation
  - Severe damage was caused by HF formation
  - Spots observed in tests due to weakness of EBD coatings

# Conclusion

- Control and monitoring of WGTS parameters on 0.1% scale is essential and well on track
- Monitoring of gas composition by Raman spectroscopy (LARA)
- LARA performance demonstrated (0.1% precision and < 6% accuracy, robust data analysis)
- Coating issue understood, solution on the way

# The LARA group

# Coating manufacturing methods

- Electron beam depositing (EBM)
- Ion assisted beam depositing (IAM)
- Magnetron sputtering (MS)
- Ion beam sputtering (IBS)

# Intensity variations

- Isotope exchange reactions in gas
- Gas - wall interactions

Stainless steel vessel wall with (H<sub>2</sub>, D<sub>2</sub>)

Permeation into stainless steel

Evacuation of vessel

Filling with T<sub>2</sub> gas

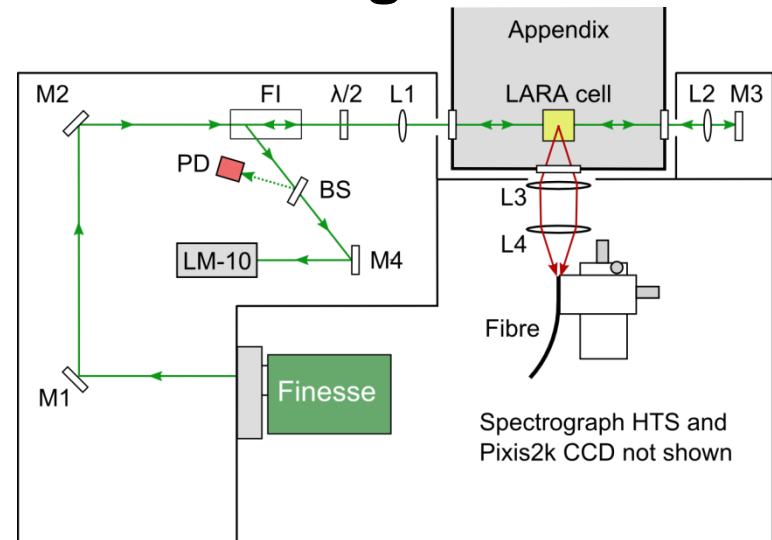

Exchange reaction with T<sub>2</sub> of next filling

# Beam path simplification, system monitoring

- Installation of faraday isolator  
→ Simplification of beam alignment
- Training of personnel for maintenance and repair

ongoing

- Definition of control procedures and hardware status parameters

Device	Parameter	Unit	Value?	Status?	Operation range (nominal) warning (fault)
CCD	Temperature (°C)		-169.59	Out of range	(-76.0 - -73.0   -73.0 - -70.0   -70.0 - -22.0)
