$d^*(2380)$ – Observation of a Dibaryon (Hexaquark) Resonance

Erice School
Sep 16 - 24, 2015

Heinz Clement

Two-Baryon Scenario

■ What do we know:

- 3S_1 deuteron groundstate: $I(J^P) = 0 (1^+)$ the only boundstate!
- 1S_0 virtual state (NN FSI): $I(J^P) = 1 (0^+)$ in addition ΔN FSI

■ What would we like to know:

- Are there six-quark bags (genuine dibaryons)?
- Are there in general resonant states (molecular, dynamic) at all?

■ Experimental findings:

- 1D_2 resonance structure at the ΔN threshold:
- 3D_3 resonance much below the $\Delta\Delta$ threshold:

$I(J^P) = 1 (2^+)$???
 $I(J^P) = 0 (3^+)$

■ Are there more states?

- Theoretical predictions
- Dyson's sextet

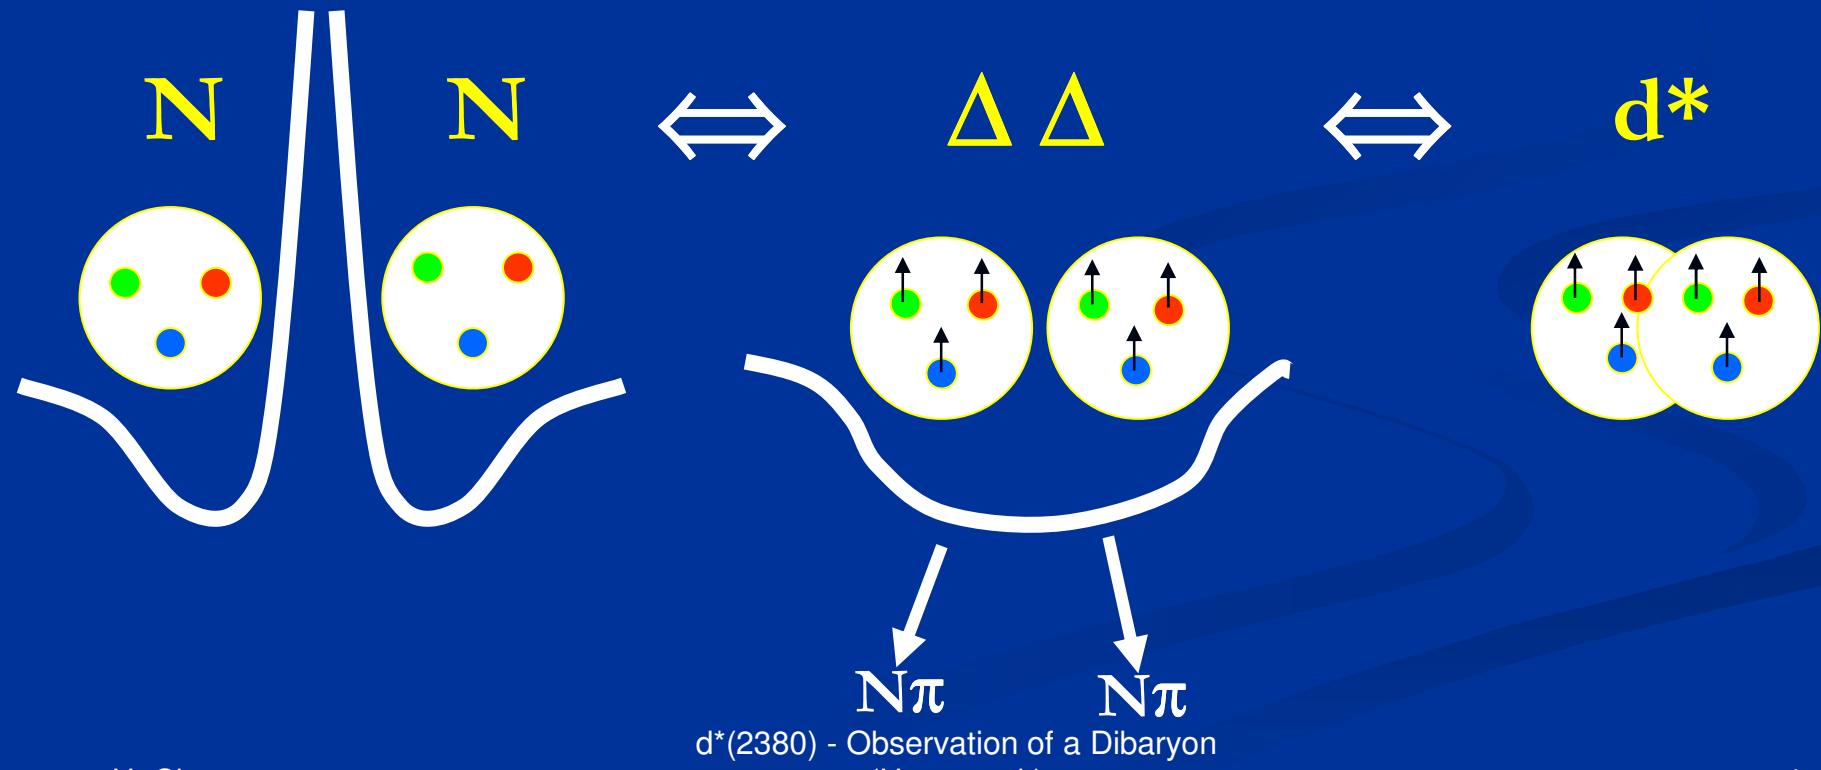

Early Predictions on Dibaryons

- 1964 Dyson & Young: 6 non-strange states
- 1975 Jaffe: H-dibaryon (uuddss: $\Lambda\Lambda$)
- Thereafter:
 - multitude of predictions of a vast number of dibaryon states (Nijmegen group,)
 - :
 - LANL theory group (T. Goldman, Fan Wang et al.):
 - The „inevitable dibaryon“: $\Delta\Delta I(J^P) = 0(3^+)$

... inevitable dibaryon

$I(J^P) = 0(3^+)$ state: totally symmetric in space, spin & color
antisymmetric in isospin
accessed via $\Delta\Delta$ as doorway ?

Early Dibaryon Searches

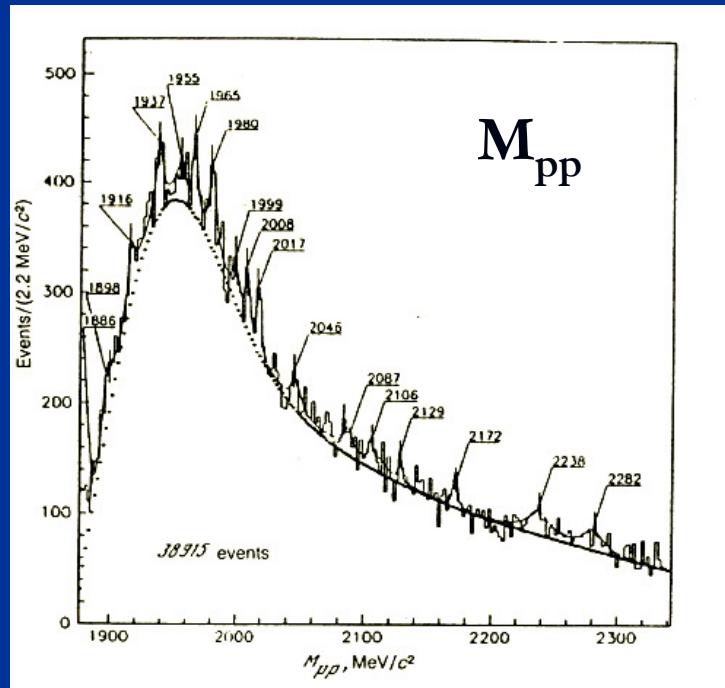

- Before 1964 (quark model):
 - First hints for resonating 1D_2 partial wave from $pp \leftrightarrow d\pi^+$ (Dubna)
- After 1975 (Jaffe's H-dibaryon prediction):
 - Worldwide searches for dibaryons

In the following: only non-strange dibaryons

The Experimental Rush for Dibaryons

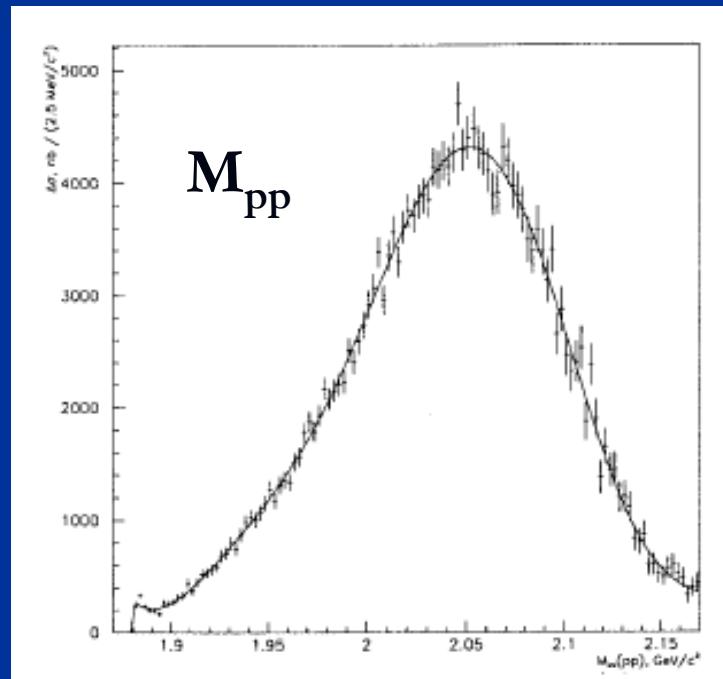

- Low statistics versus high statistics (quality):

$np \rightarrow pp\pi^- + n\pi^0$, bubble chamber

Troyan & Pechenov, Phys. At. Nucl. 56 (1993) 528

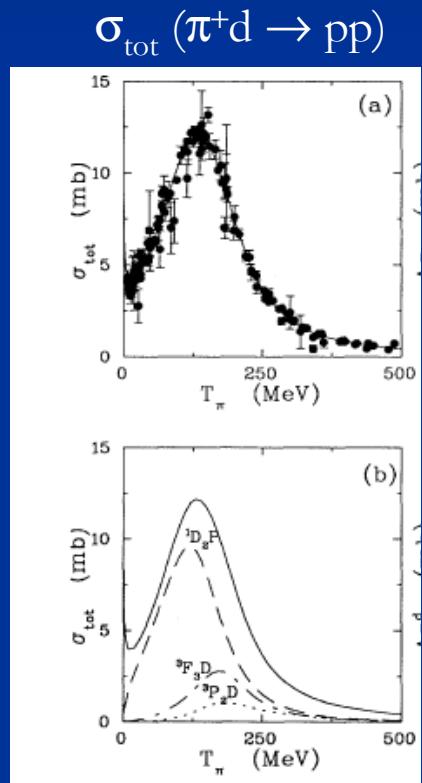

$np \rightarrow pp\pi^-$, magn. spectrometer

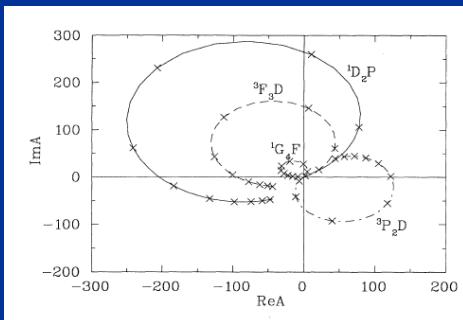

Abramov et al., Z. Phys. C69 (1996) 409

Possibly the only survivor: 1D_2 Resonance

- Best seen in $pp \leftrightarrow d\pi^+$,
- but also in $pp \rightarrow pn\pi^+$ as well as pp and π^+d scattering (phaseshift analyses)

563

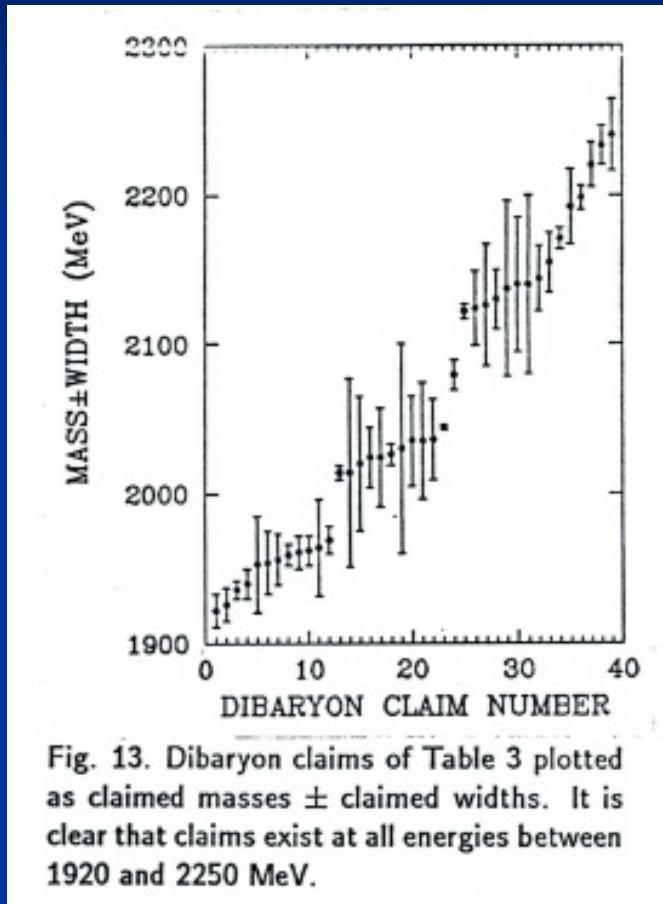

569

$I(J^P) = 1(2^+)$
 $M = 2144 \text{ MeV} = m_\Delta + m_N - 26 \text{ MeV}$
 $\Gamma = 110 \text{ MeV} \approx \Gamma_\Delta$

Alternative **dynamic** description: Diss. C.A. Mosbacher, Bonn 1998

$d^*(2380)$ - Observation of a Dibaryon
(Hexaquark)

One of the Conclusions about this Dibaryon Rush

Kamal Seth (1988)
in
„Dibaryons in
Theory and Practice“

- 1) „Nobody has seen a genuine, gold-(silver-, ... or even un-) plated dibaryon, yet.“
- 2) „The days of Q & D ... are over...
We must do honest hard work, or quit...
We should do exclusive experiments.“

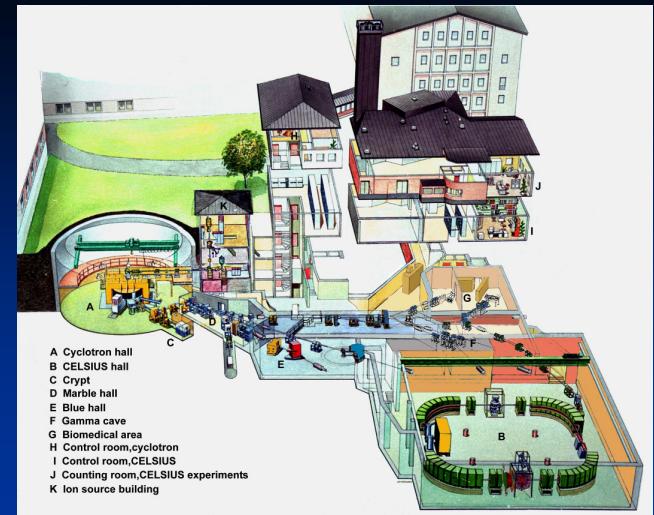

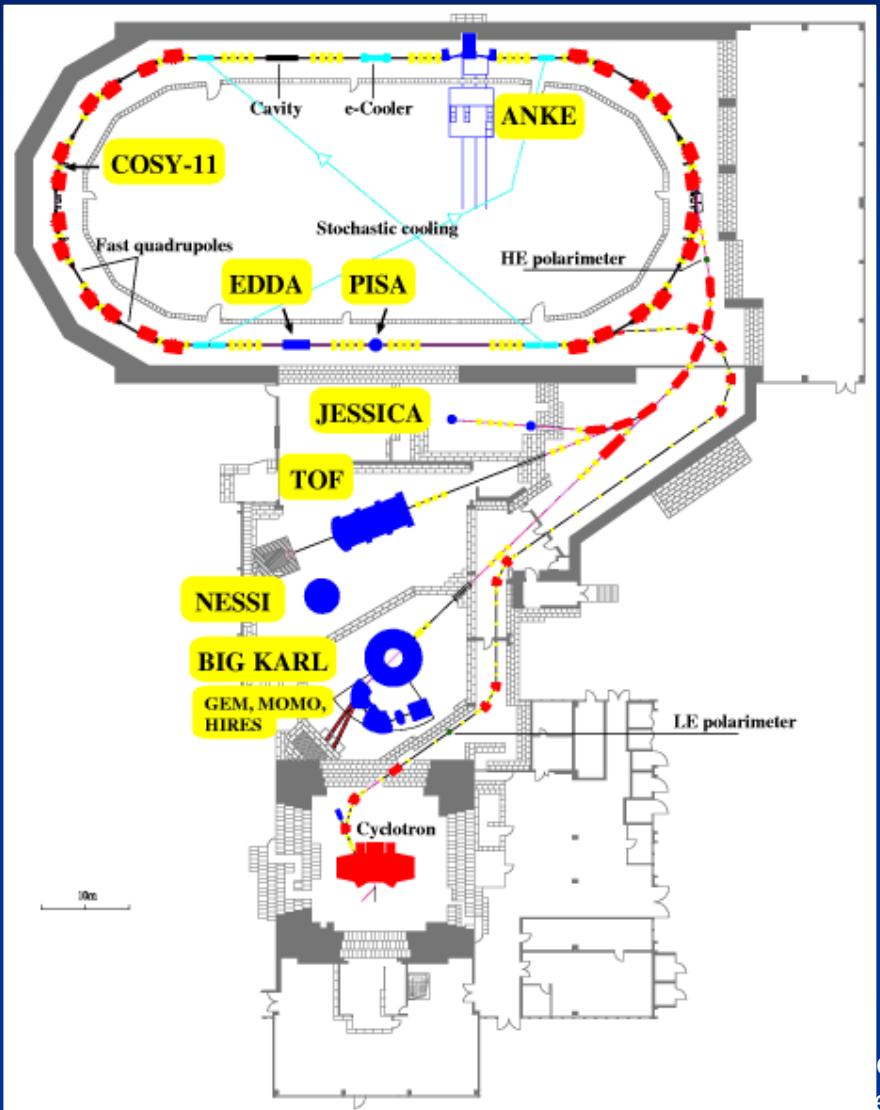

So how to find a Dibaryon?

Exclusive and kinematically complete measurements

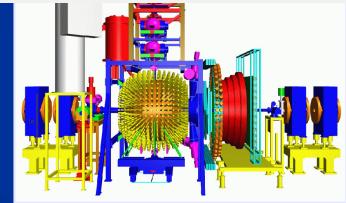

■ Our approach:

- Two-pion production with best suited equipment
 - 4π detector: WASA
 - pellet target: p and d
 - storage ring: CELSIUS → COSY
- The learning phase:
 - pp induced two-pion production
- Following a trace:
 - the ABC effect in double-pionic fusion
- The surprise:
 - a narrow resonance in pn induced two-pion production

WASA at COSY

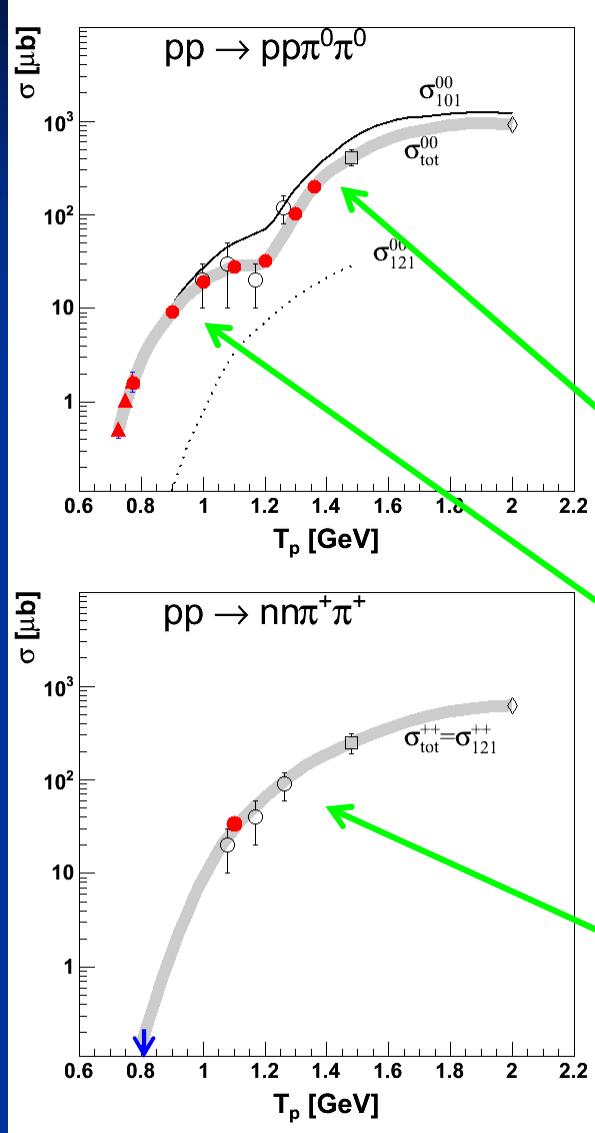

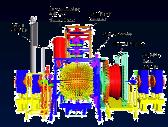

2005 - 2006

Crucial Experiment for d^*

- If d^* a true s-channel resonance
- \Leftrightarrow
- then also a resonance in the np system
- \Leftrightarrow
- to be sensed in np scattering
- \Leftrightarrow
- in particular in the analyzing power
- \Leftrightarrow
- resonance effect $\sim P_3^1(\Theta)$
- i.e. maximal at $\Theta = 90^\circ$

(Hexaquark)

$d^*(2380)$ internal structure and the ABC effect

$d^*(2380)$ - Observation of a Dibaryon
(Hexaquark)

Conclusions

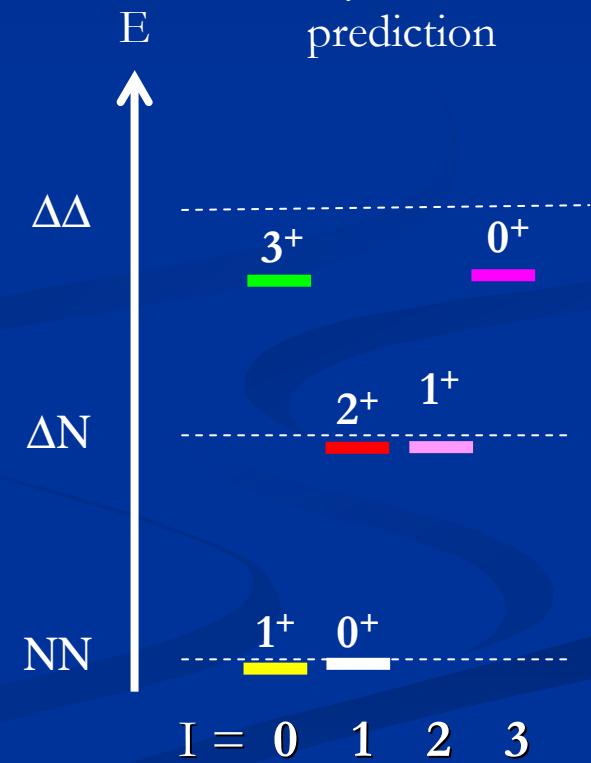

- Non-Strange Two-Baryon Spectrum
 - 3 established states: 3S_1 deuteron groundstate
 1S_0 virtual state
 1D_2 resonance (ΔN)
 - 1 new - presumably exotic - state:
 $d^*(2380)$ resonance ($\Delta\Delta$)
 - Are there more states?
 - NN-decoupled states with $I = 2, 3$?
 - Search in $pp \rightarrow pp\pi^+ \pi^-$
and in $pp \rightarrow pp\pi^+\pi^+ \pi^-\pi^-$
- Strange, charmed ... Di-Baryons?

Zhang, Chen, Shen et al.

Huang, Ping, Wang et al.

Gal & Garcilazo

Dyson's prediction

$d^*(2380)$ - Observation of a Dibaryon
(Hexaquark)

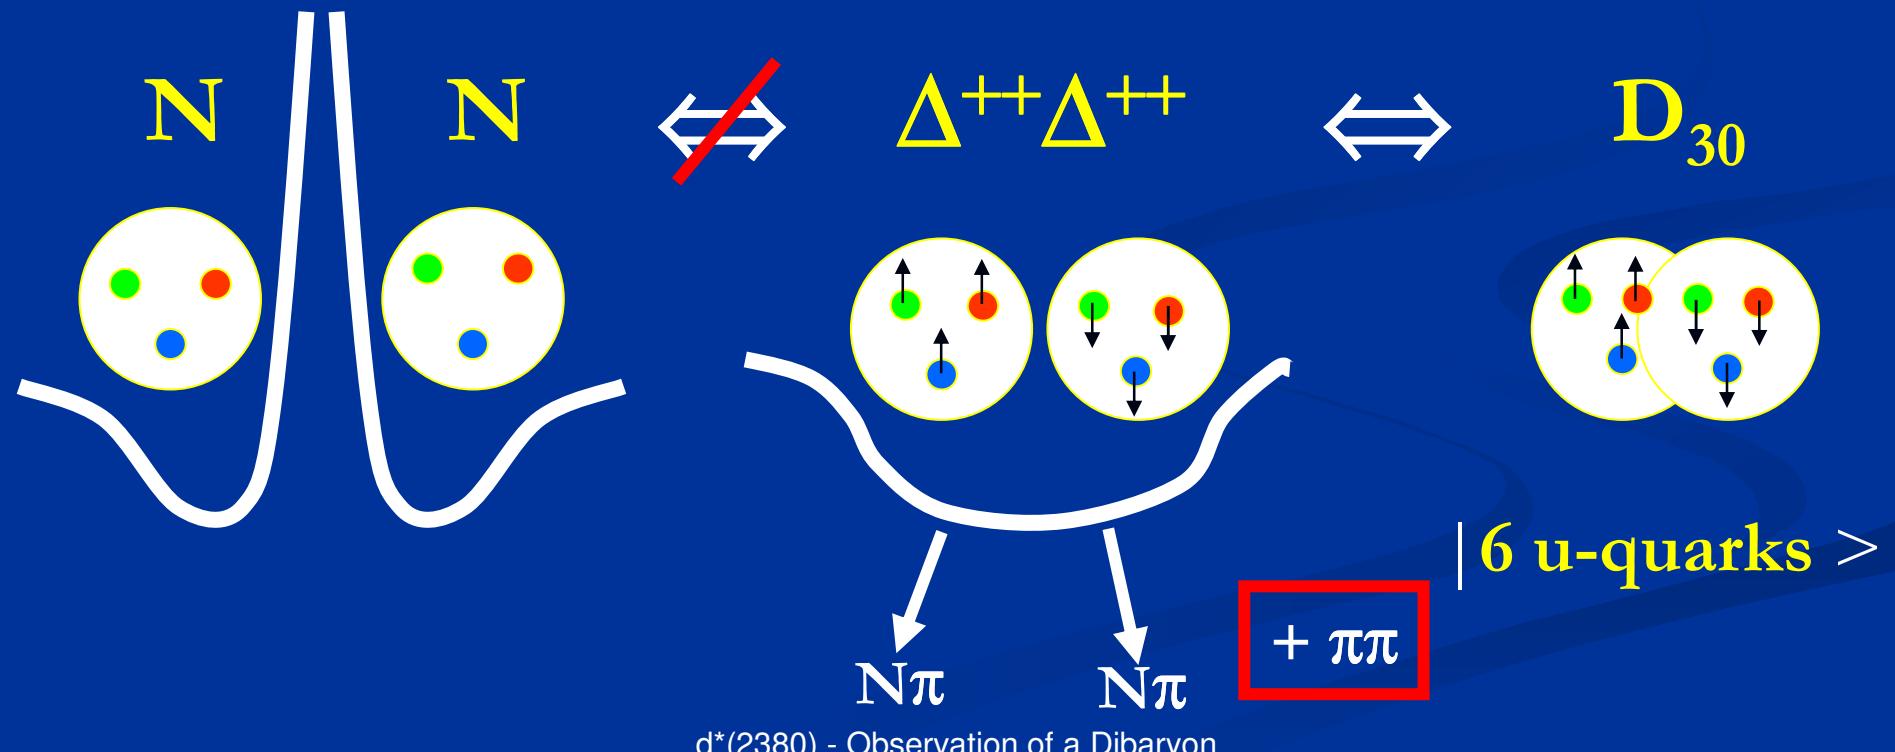

Outlook and Open Problems

- Size of $d^*(2380)$
 - \Rightarrow elm excitation of d^* $\gamma d \rightarrow d^* \rightarrow pn$
 - $\rightarrow d\pi^0\pi^0$
 - Observation at other installations
 - HADES @ GSI: under way, but no 4π and no neutrals
 - IHEP ?? $e^+e^- \rightarrow d \bar{d}^*$ at $4.3 - 4.6$ GeV ??
 - Are there more (exotic) dibaryons?
 - Mirror state of d^* ..., strange, charmed dibaryons

Outlook: mirror dibaryon

$I(J^P) = 3(0^+)$: totally symmetric in space, isospin & color
antisymmetric in spin
accessed via $\Delta^{++}\Delta^{++}$ as asymptotic configuration

$d^*(2380)$ - Observation of a Dibaryon
(Hexaquark)
