

Study the QCD Phase Structure in High-Energy Nuclear Collisions

Nu Xu^(1,2)

⁽¹⁾ College of Physical Science & Technology, Central China Normal University, China

⁽²⁾ Nuclear Science Division, Lawrence Berkeley National Laboratory, USA

Outline

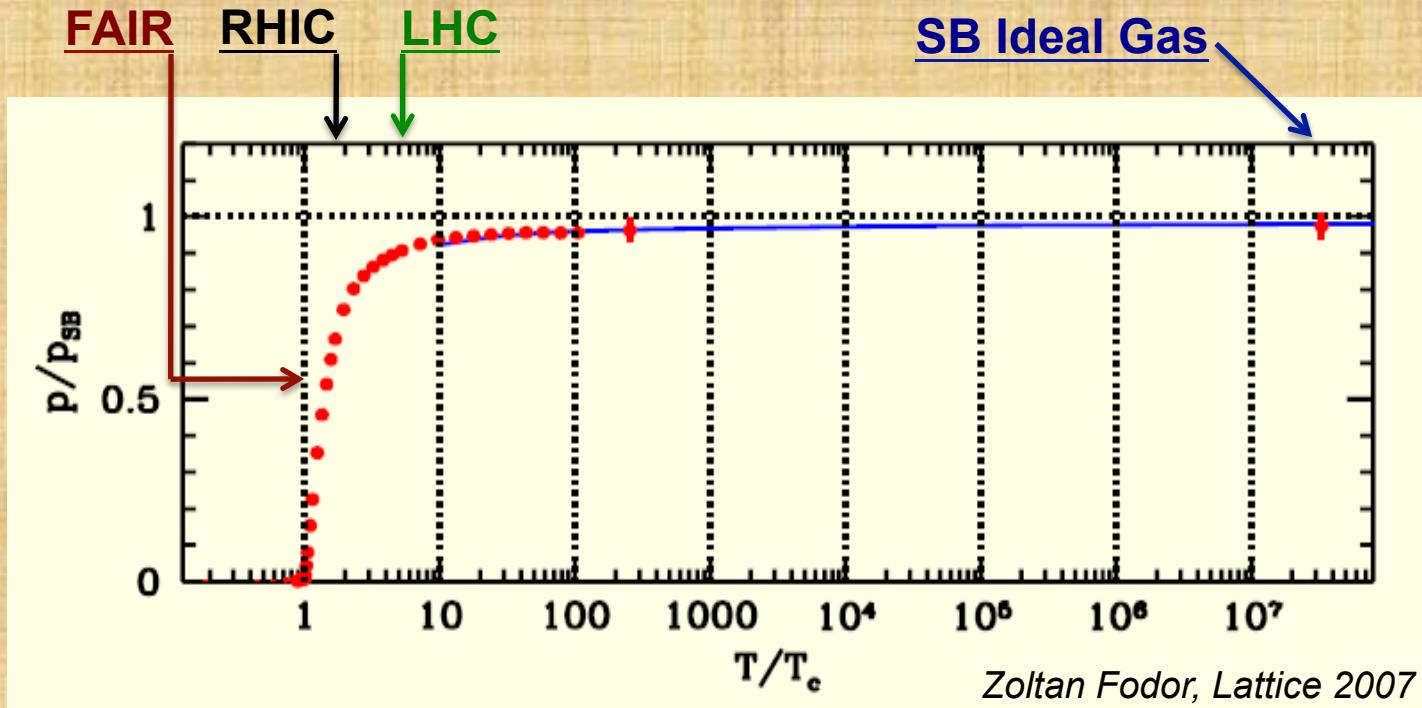

(1) Introduction

(2) Recent Results from BES-I

- i. Collectivity; ii. Criticality; iii. Chirality

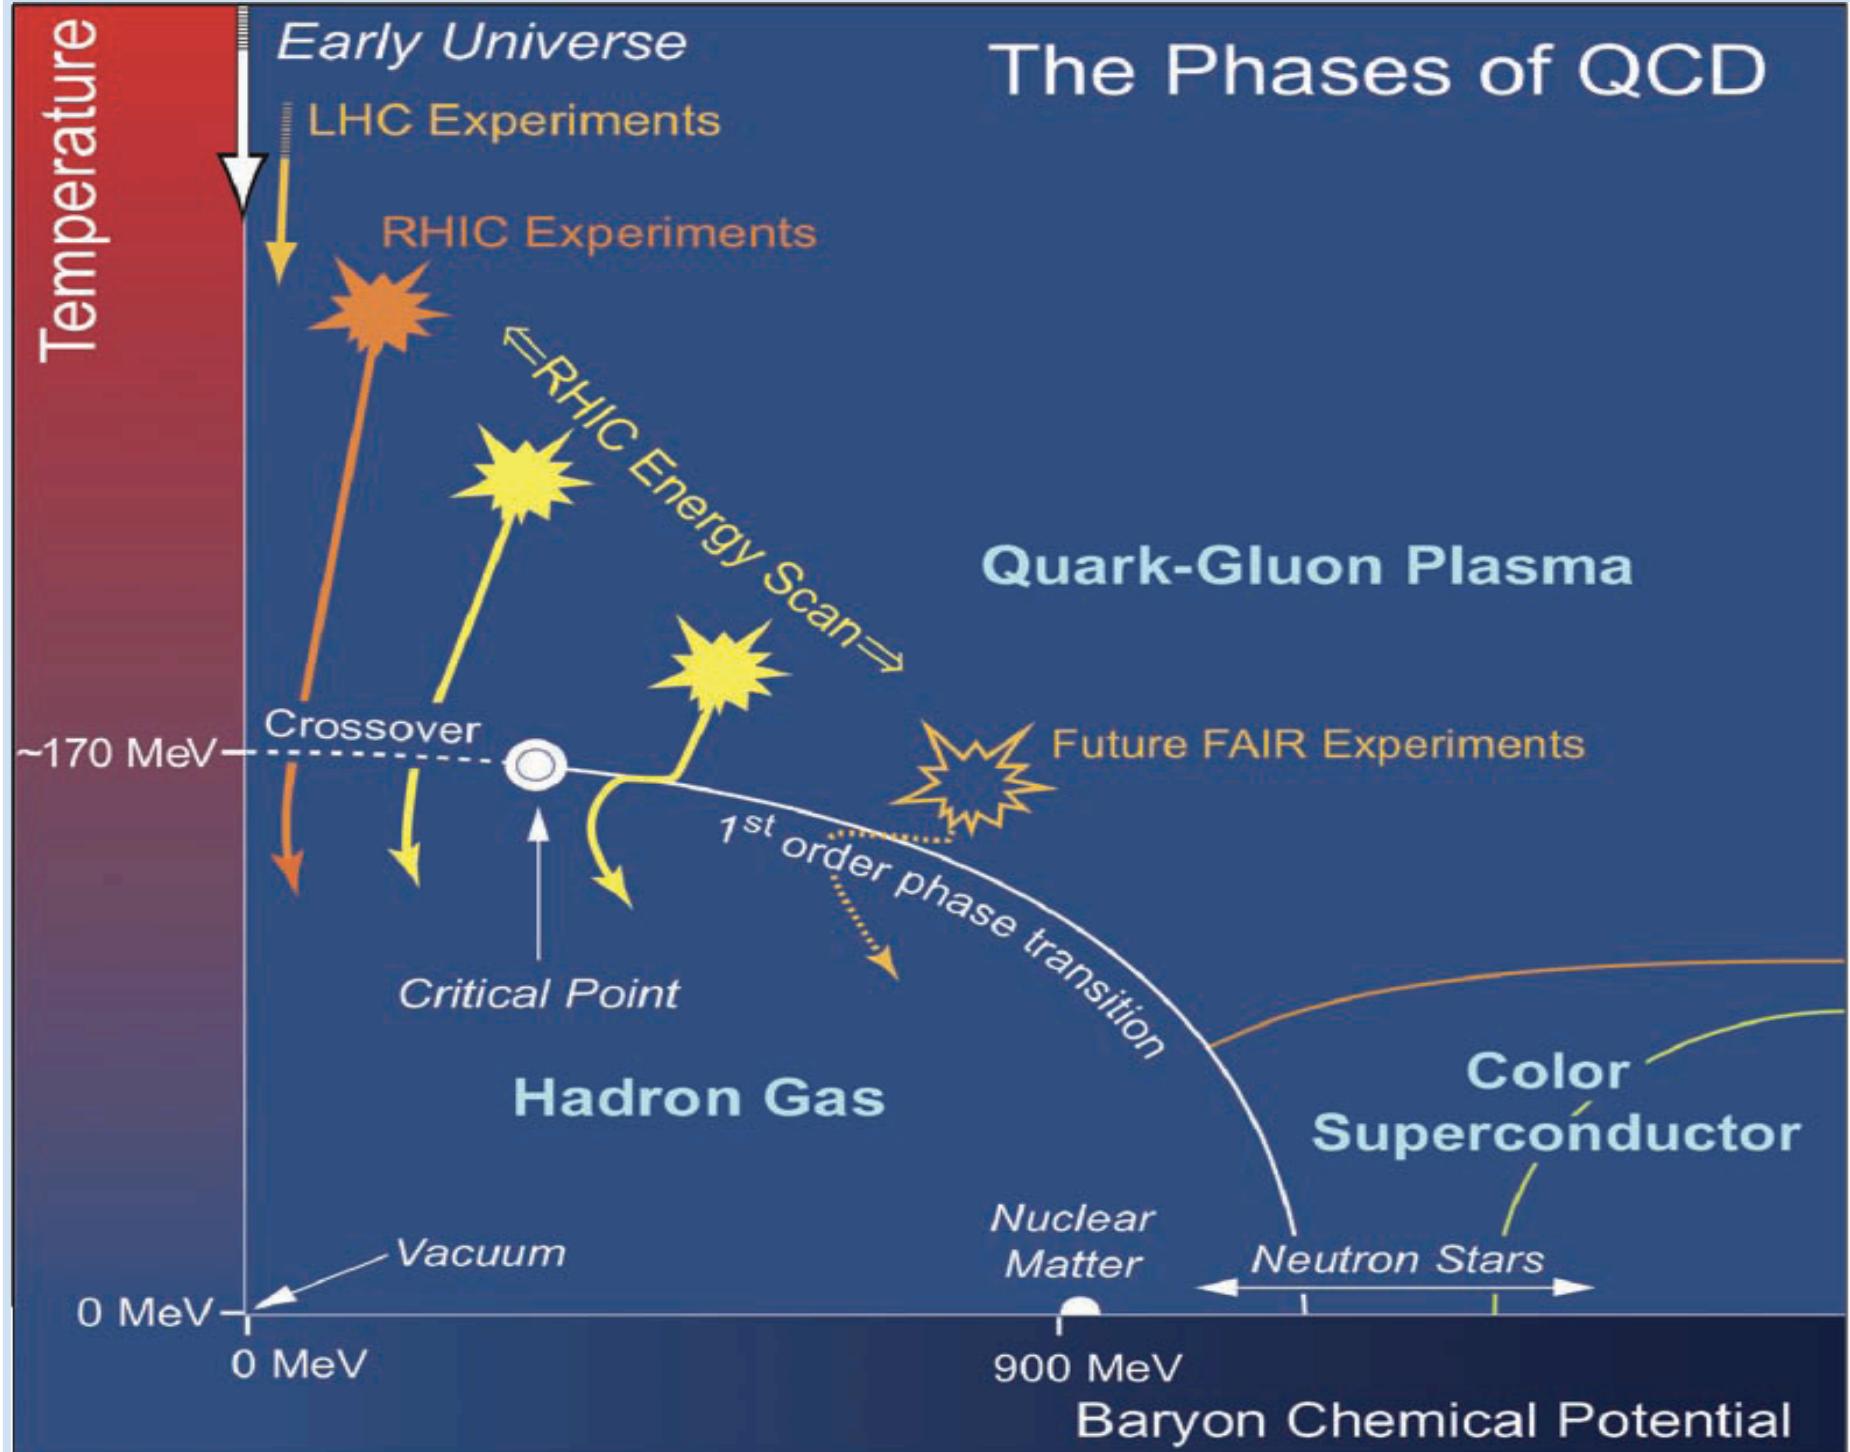

(3) Physics Program in BES-II

QCD Thermodynamics

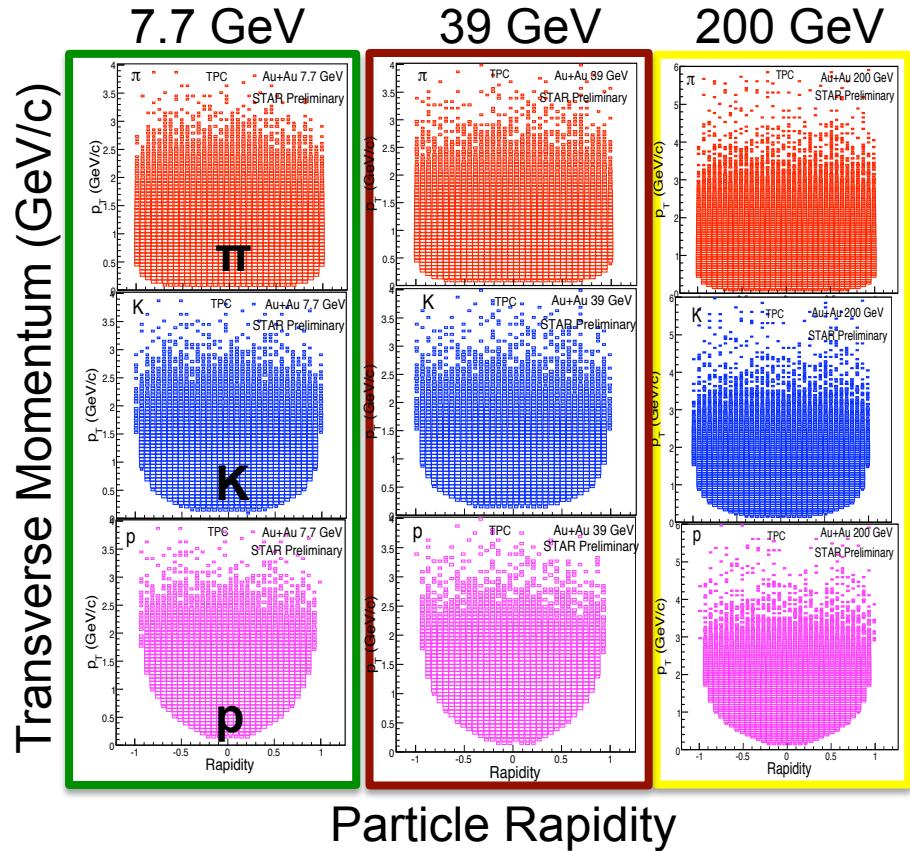

- 1) At $\mu_B = 0$: cross over transition, $140 < T_c < 160 \text{ MeV}$
- 2) $T_{ini}(\text{LHC}) \sim 2\text{-}3 * T_{ini}(\text{RHIC})$
- 3) Thermalized, evolutions are similar for RHIC and LHC
- 4) RHIC BES and FAIR: large μ_B , rapid changes occurs

The Phases of QCD

Data Sets at STAR

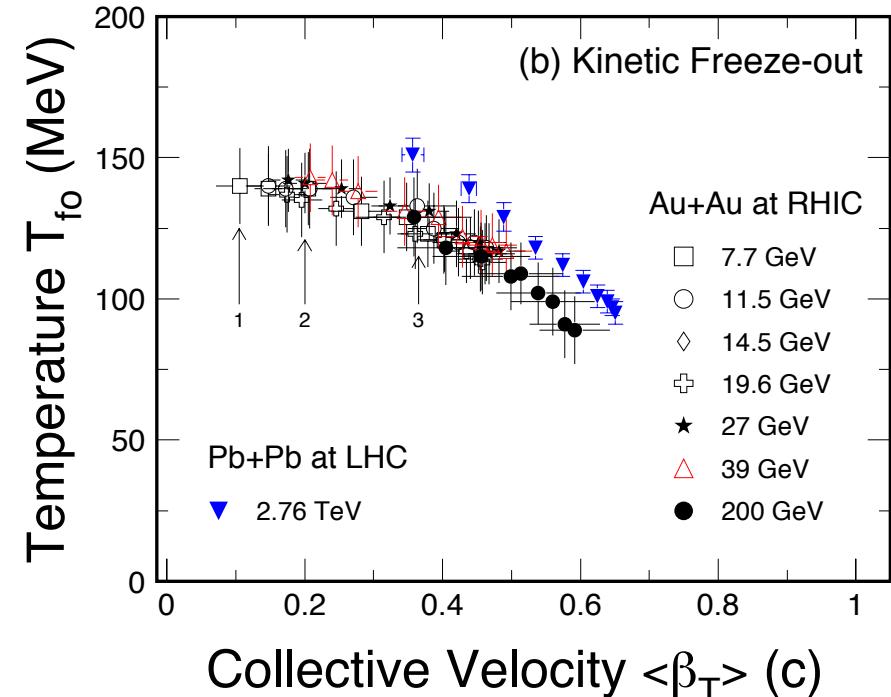

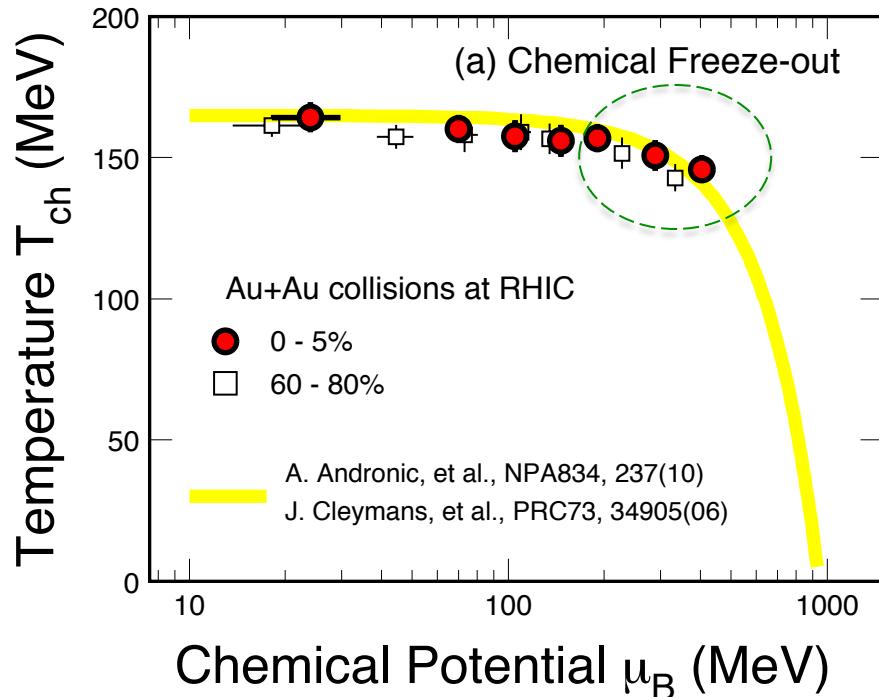

| $\sqrt{s_{NN}}$ (GeV) | Events (10^6) | Year | * μ_B (MeV) | * T_{CH} (MeV) |
|--------------------------|----------------------|------|--------------------|---------------------|
| 200 | 350 | 2010 | 25 | 166 |
| 62.4 | 67 | 2010 | 73 | 165 |
| 39 | 39 | 2010 | 112 | 164 |
| 27 | 70 | 2011 | 156 | 162 |
| 19.6 | 36 | 2011 | 206 | 160 |
| 14.5 | 20 | 2014 | 264 | 156 |
| 11.5 | 12 | 2010 | 316 | 152 |
| 7.7 | 4 | 2010 | 422 | 140 |

- 1) Largest data sets versus collision energy
- 2) STAR: Large and homogeneous acceptance, excellent particle identification capabilities. Important for fluctuation analysis!

*(μ_B , T_{CH}) : J. Cleymans et al., PR C73, 034905 (2006)

Bulk Properties at Freeze-out

Chemical Freeze-out: (GCE)

- Weak temperature dependence
- Centrality dependence μ_B !
- Lattice prediction on CP around $\mu_B \sim 300 - 400$ MeV

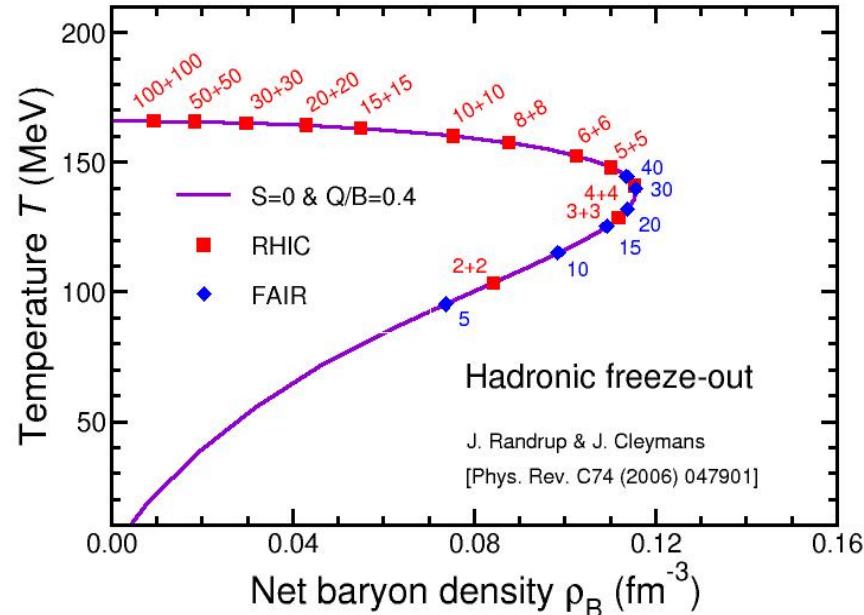

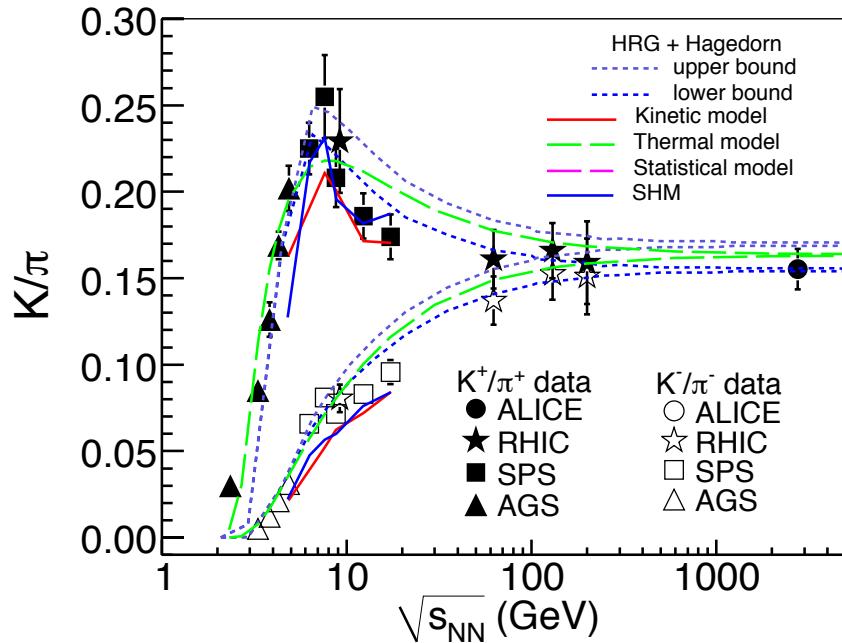

Kinetic Freeze-out:

- Central collisions => lower value of T_{fo} and larger collectivity β_T
- Stronger collectivity at higher energy, even for peripheral collisions

ALICE: B.Abelev et al., PRL109, 252301(12); PRC88, 044910(2013).

STAR: J. Adams, et al., NPA757, 102(05); X.L. Zhu, NPA931, c1098(14); L. Kumar, NPA931, c1114(14)

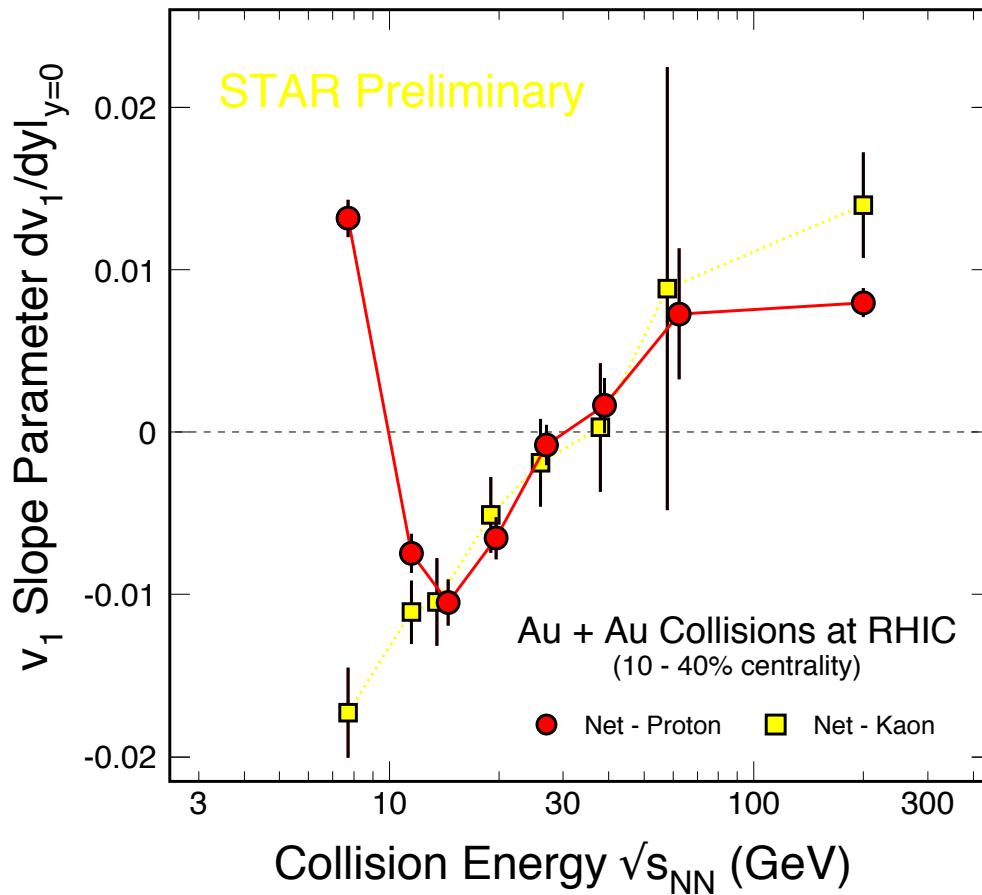

K^+/π Ratios and Baryon Density

- 1) In heavy ion collisions K^+/π ratio peaks at $\sqrt{s_{NN}} \sim 8$ GeV, K^-/π ratio is a smooth and merges with K^+/π at higher collision energy
- 2) Model: Baryon density reaches a maximum at $\sqrt{s_{NN}} \sim 8$ GeV
- 3) At $\sqrt{s_{NN}} > 8$ GeV, pair production becomes important

L. Kumar, et al. 1304.2969

Directed Flow v_1 Results

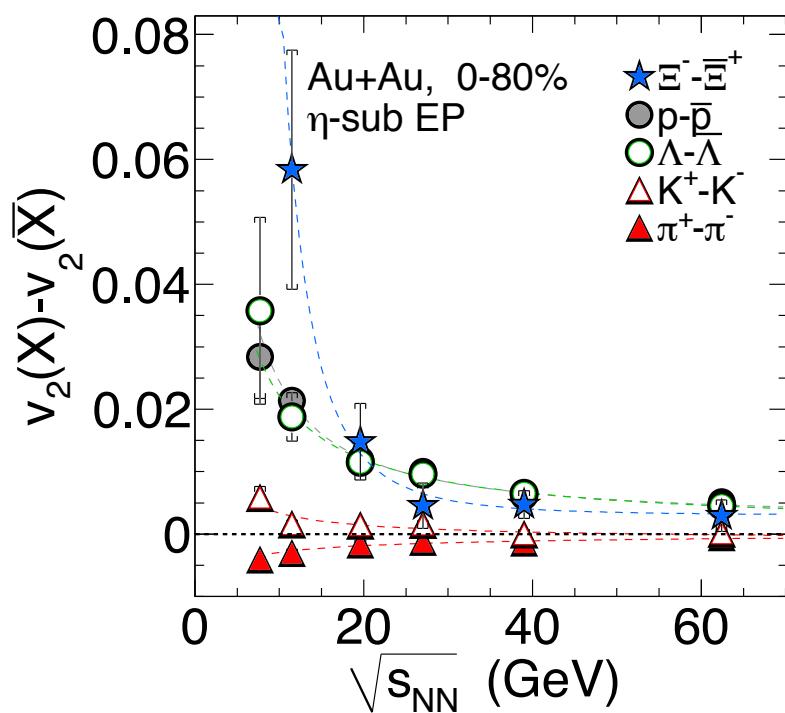

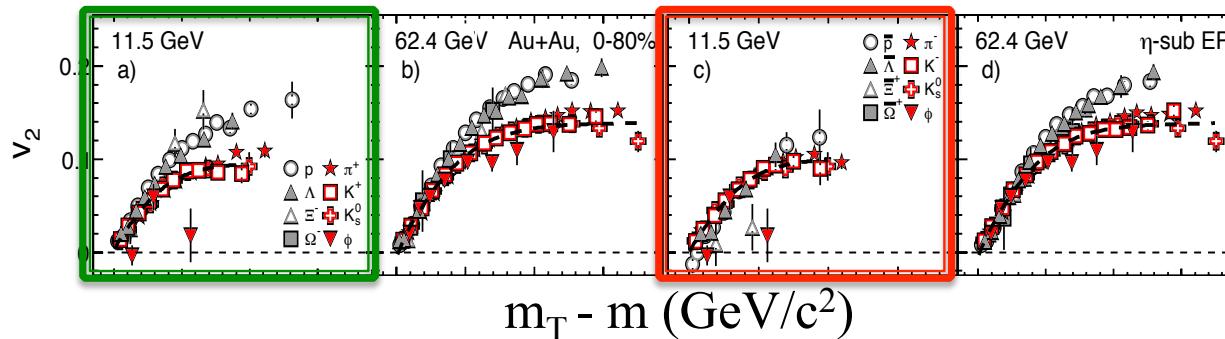

- 1) Mid-rapidity net-proton dv_1/dy published in 2014 by STAR, except the point at 14.5 GeV
- 2) Minimum at $\sqrt{s_{NN}} = 14.5$ GeV for net-proton, but net-Kaon data continue decreasing as energy decreases
- 3) At low energy, or in the region where the net-baryon density is large, repulsive force is expected, v_1 slope is large and positive!

M. Isse, A. Onishi et al, PRC72, 064908(05)

STAR: PRL112, 162301(2014)

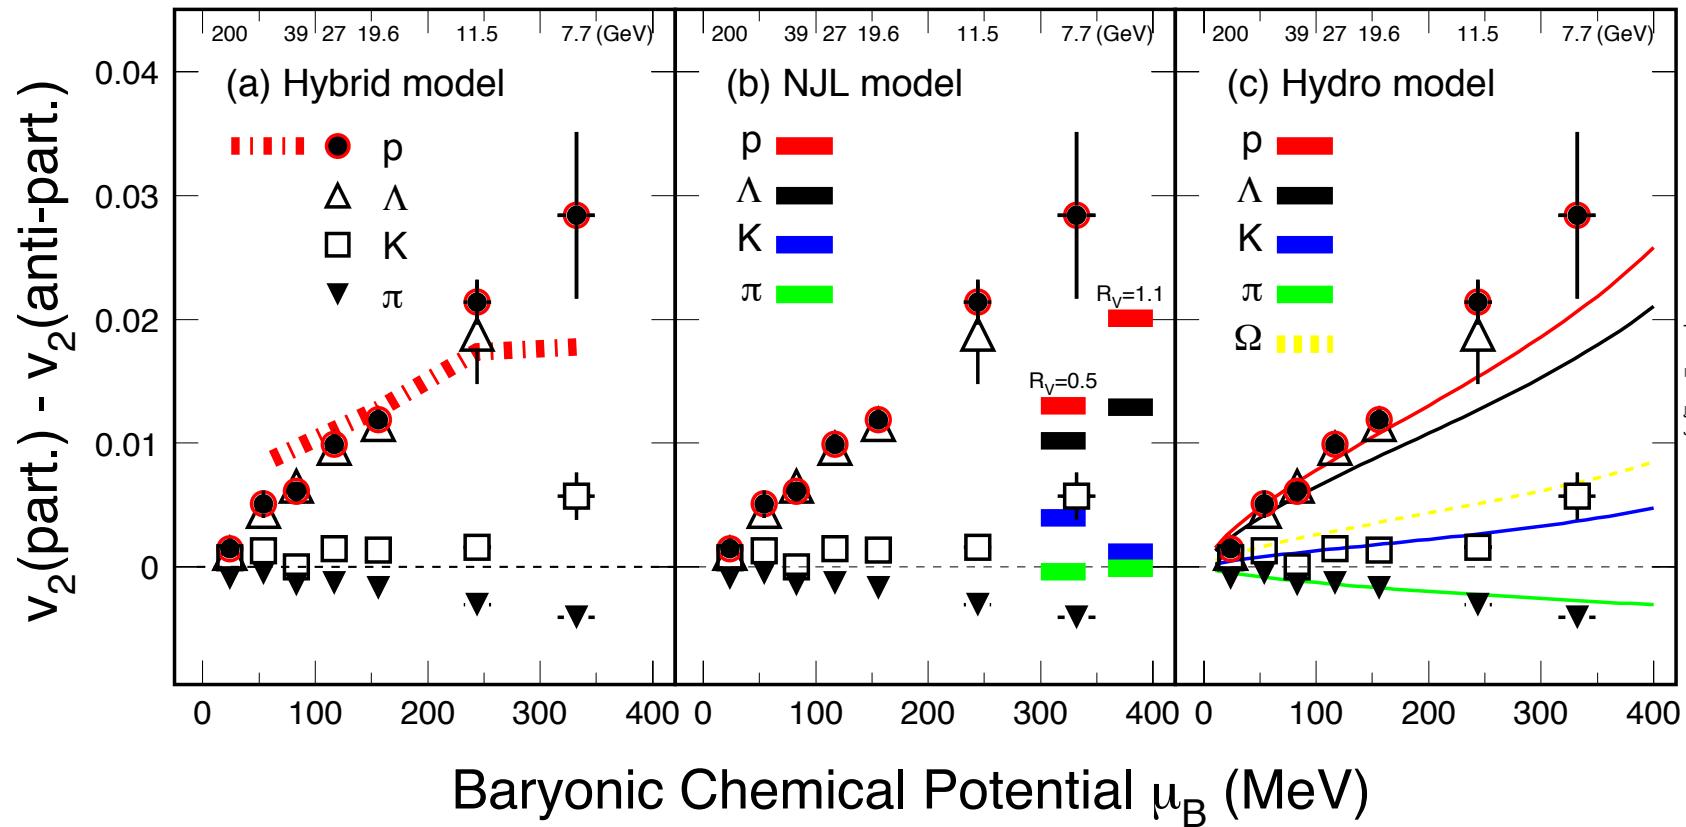

Collectivity v_2 Measurements

STAR: PR110 (2013) 142301

- 1) Number of constituent quark (NCQ) **scaling** in v_2
=> **partonic collectivity**
=> **deconfinement** in high-energy nuclear collisions
- 2) At $\sqrt{s_{NN}} < 11.5$ GeV, the universal **NCQ scaling** in v_2 is **broken**, consistent with hadronic interactions becoming dominant

BES v_2 and Model Comparison

(a) Hydro + Transport: Baryon results fit

[J. Steinheimer, et al. PR **C86**, 44902(13)]

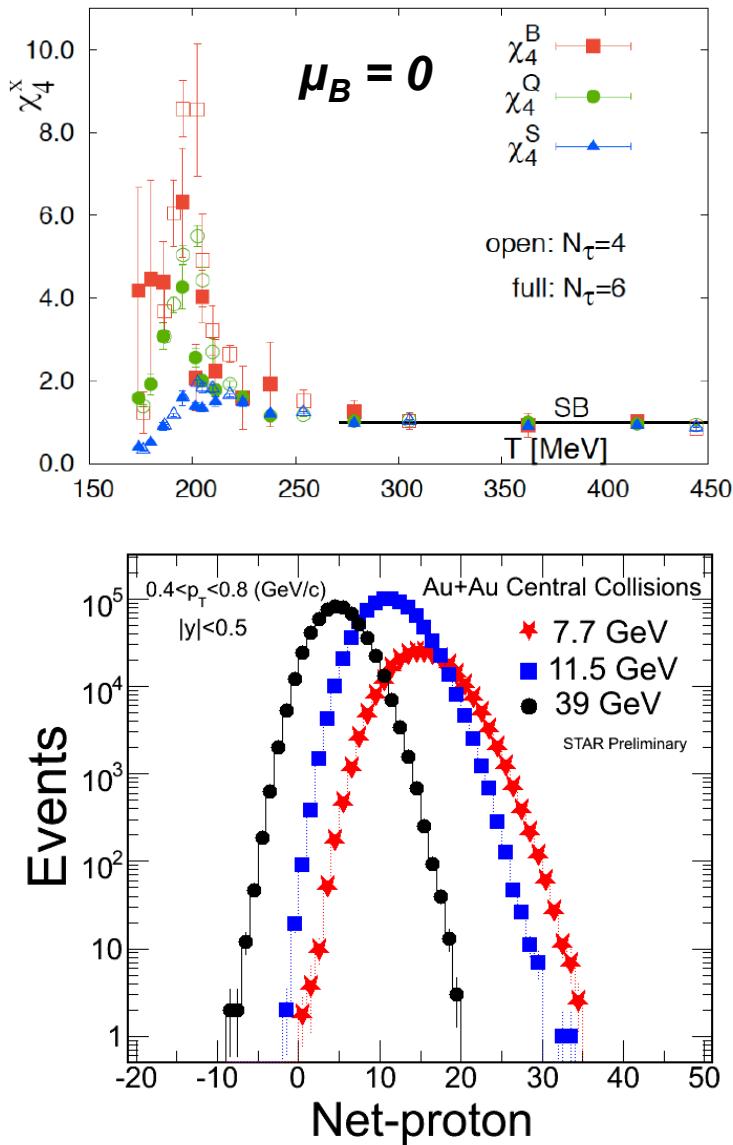

(b) NJL model: Sensitive to vector-coupling, **CME**, μ_B driven.

[J. Xu, et al., PRL **112**.012301(14)]

(c) Hydro solution: **Chemical potential μ_B** and **viscosity η/s** driven!

[Hatta et al. PR **D91**, 085024(15); **D92**, 114010(15) //NP **A947**, 155(16)]

Higher Moments

1) Higher moments of conserved quantum numbers: **Q , S , B** , in high-energy nuclear collisions

2) Sensitive to critical point (ξ correlation length):

$$\langle (\delta N)^2 \rangle \approx \xi^2, \quad \langle (\delta N)^3 \rangle \approx \xi^{4.5}, \quad \langle (\delta N)^4 \rangle \approx \xi^7$$

3) Direct comparison with calculations at any order:

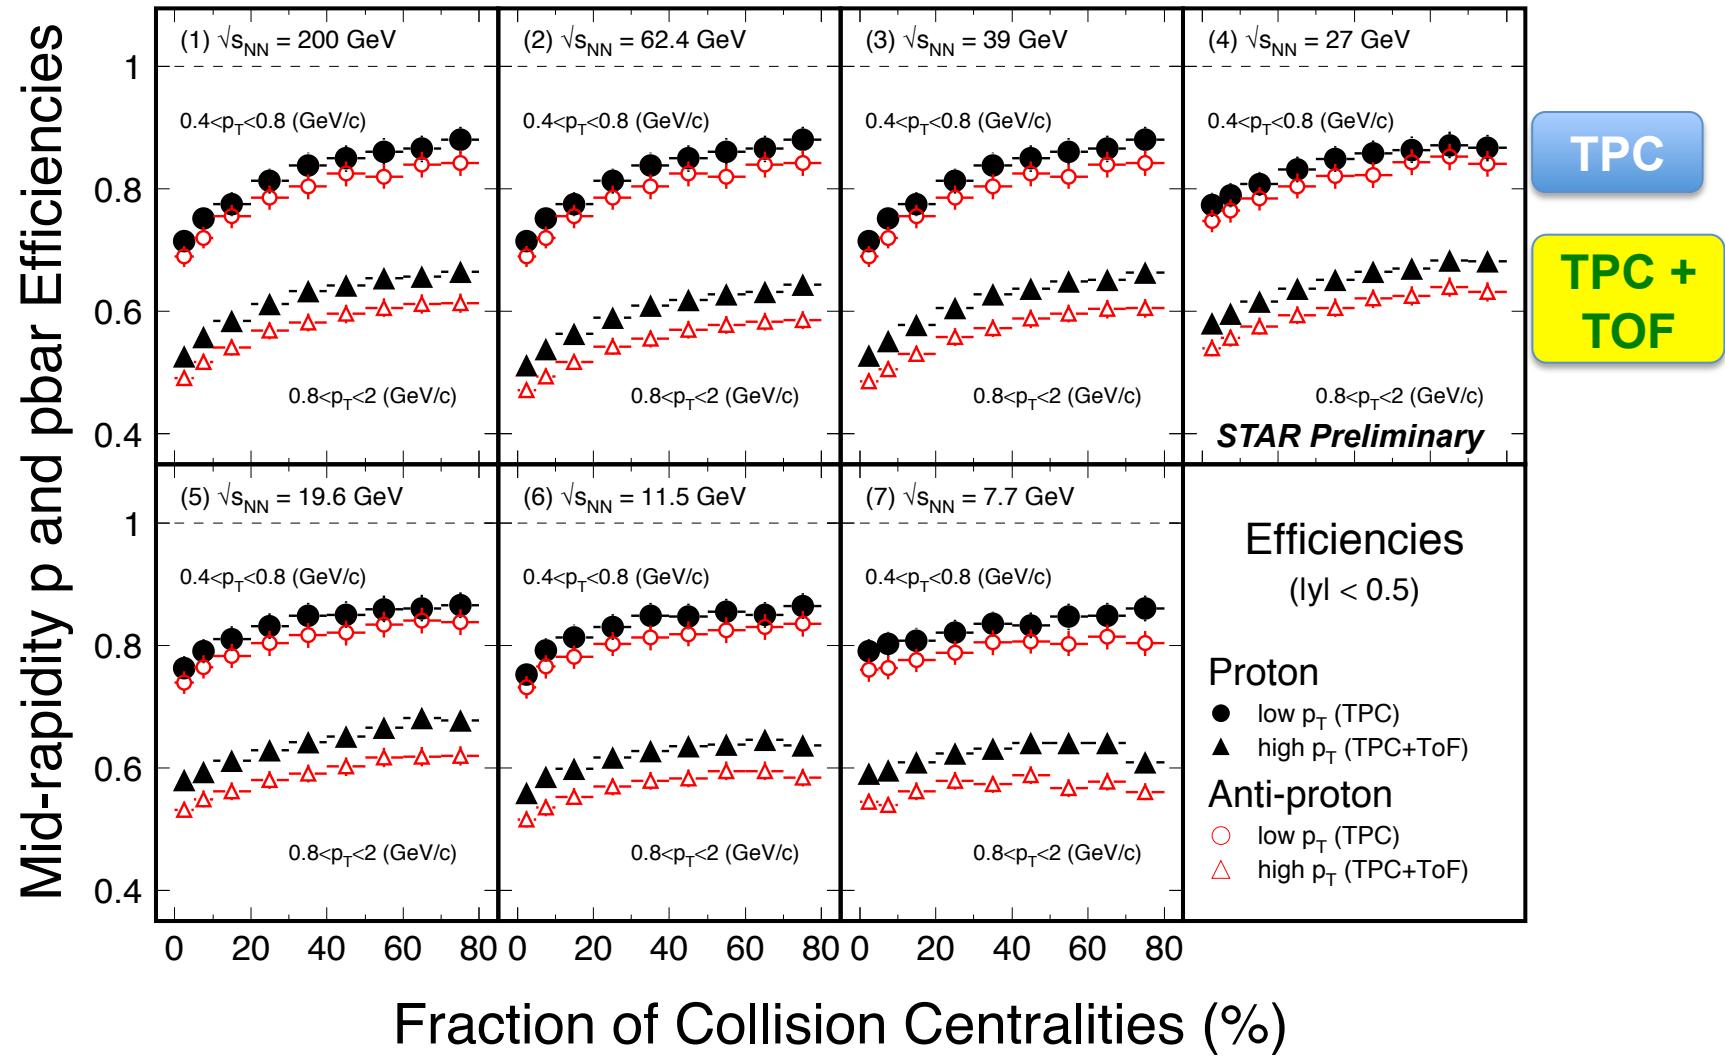

$$S\sigma \approx \frac{\chi_B^3}{\chi_B^2}, \quad \kappa\sigma^2 \approx \frac{\chi_B^4}{\chi_B^2}$$

4) **Extract susceptibilities and freeze-out temperature.** An independent/important test of thermal equilibrium in heavy ion collisions.

Au + Au Collisions at RHIC

Proton Identification with TOF

Published net-proton results: Only TPC used for proton/anti-proton PID.
TOF PID extends the phase space coverage.

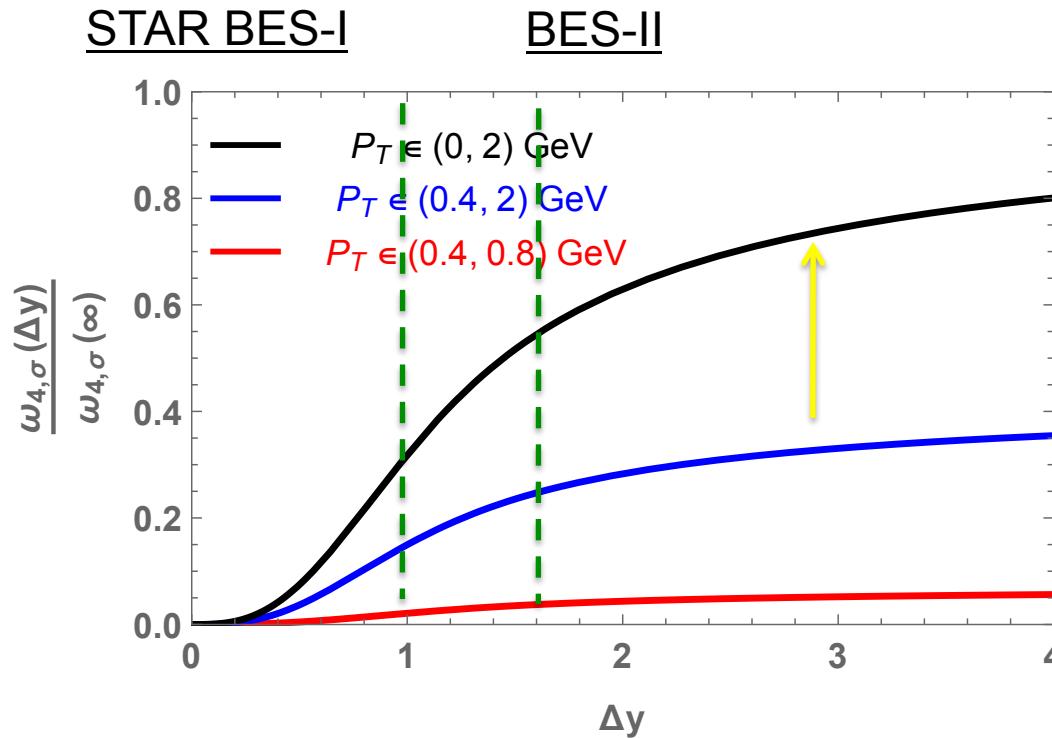

Acceptance: $|y| \leq 0.5$, $0.4 \leq p_T \leq 2 \text{ GeV}/c$
Efficiency corrections:

TPC ($0.4 \leq p_T \leq 0.8 \text{ GeV}/c$): $\epsilon_{\text{TPC}} \sim 0.8$

TPC+TOF ($0.8 \leq p_T \leq 2 \text{ GeV}/c$): $\epsilon_{\text{TPC}} * \epsilon_{\text{TOF}} \sim 0.5$

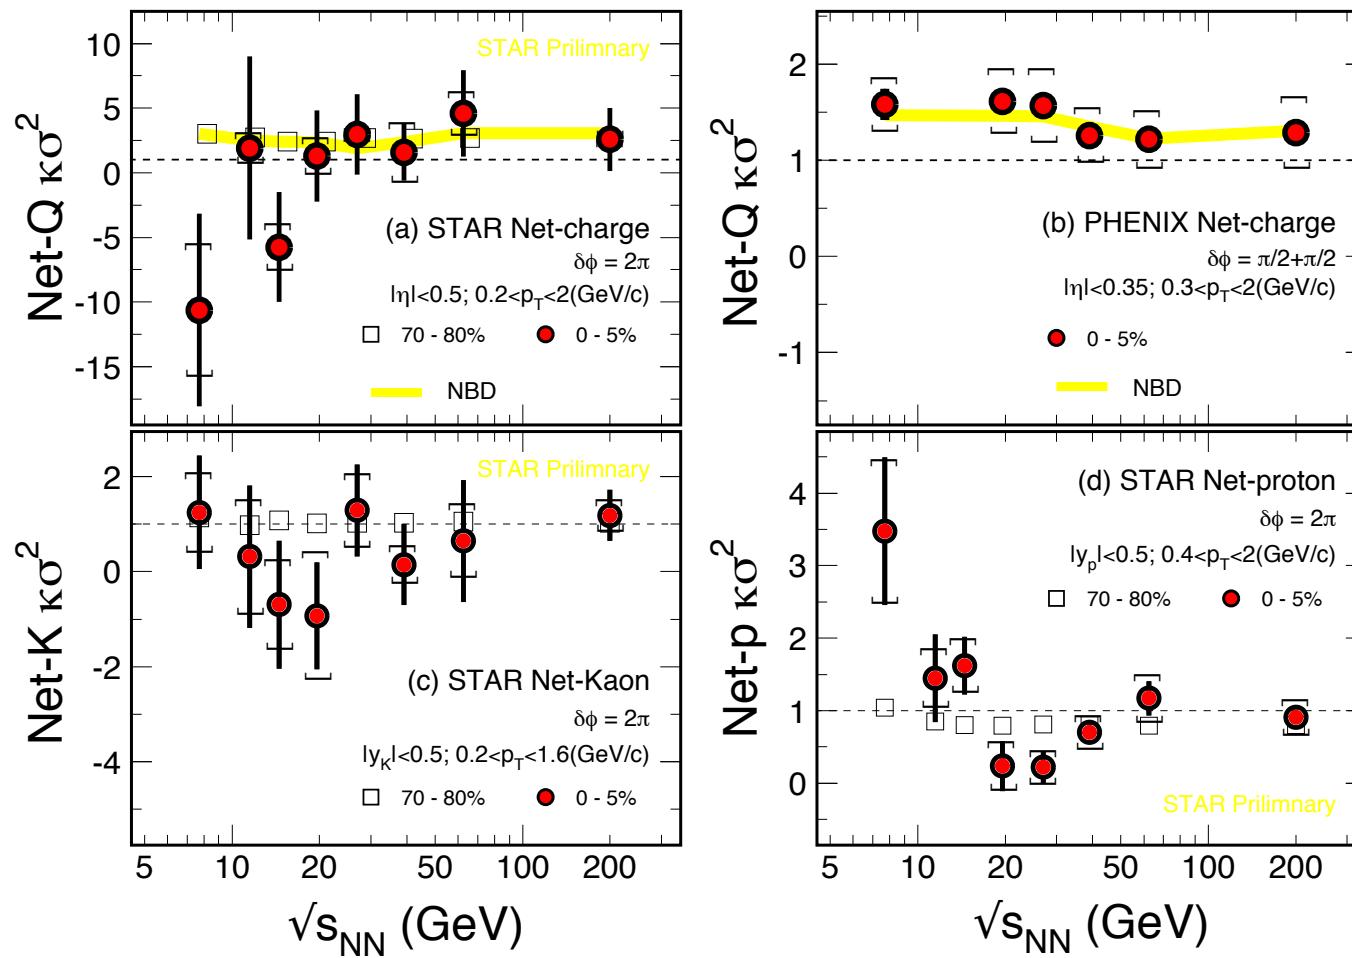

Acceptance

B. Ling, M. Stephanov, 1512.09125

- 1) Acceptance is important!
- 2) Low p_T of protons is more important than wider rapidity.
Fixed-target experiment is more advantageous

Higher Moments of Net-Q, -K, -p

$$error(\kappa * \sigma^2) \propto \frac{1}{\sqrt{N}} \frac{\sigma^2}{\varepsilon^2}$$

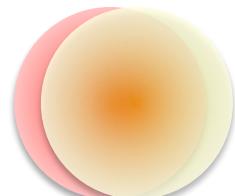

In STAR:

$$\sigma(Q) > \sigma(K) > \sigma(p)$$

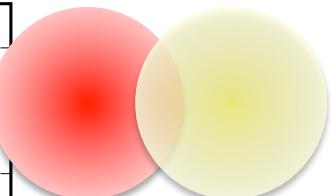

- 1) Higher moment of net-Q, net-Kaon, and net-proton measured at RHIC BES-I
- 2) Net-p shows **non-monotonic energy dependence** in the most central Au+Au collisions at $\sqrt{s_{NN}} < 27$ GeV!

PHENIX: talk by P. Garg at QM2015; STAR: talk by J. Thäder and poster by J. Xu at QM2015

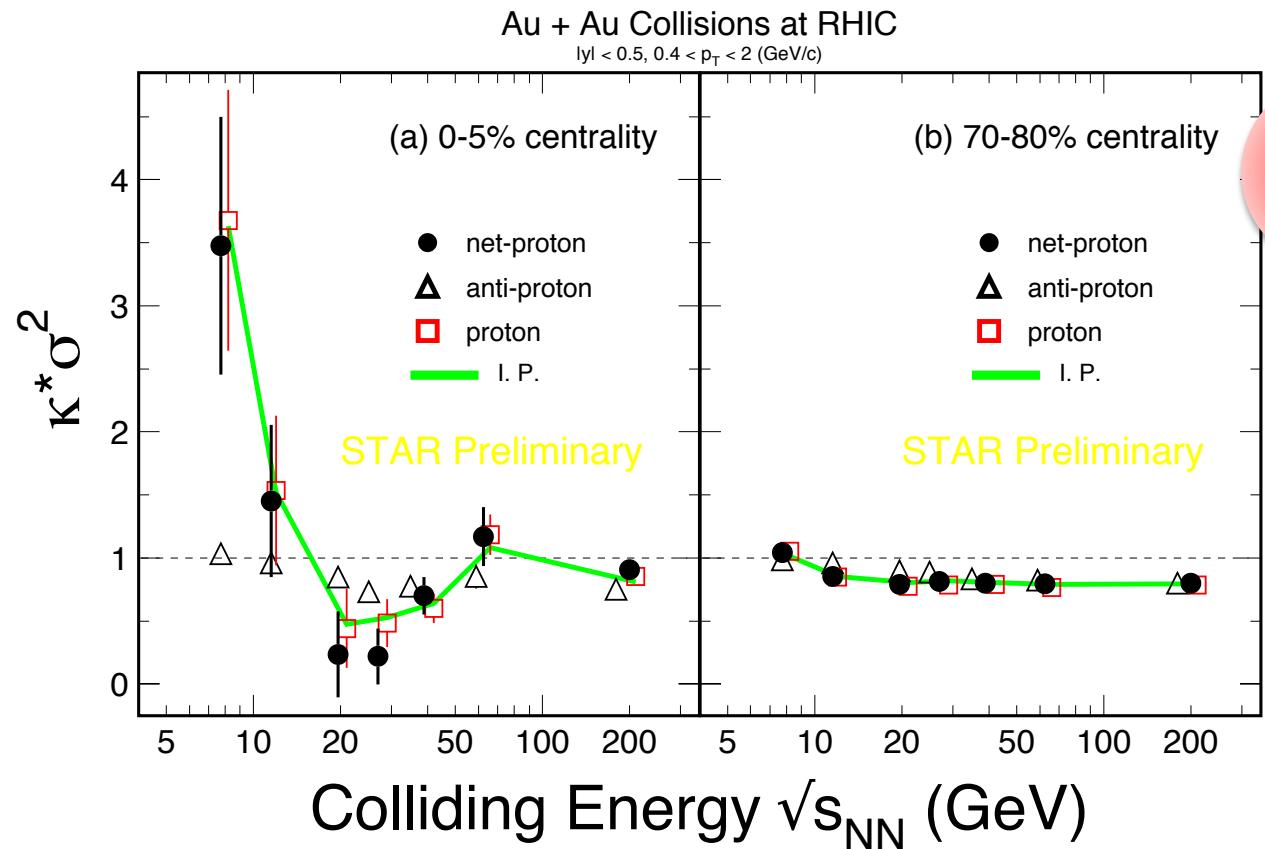

Net-proton Higher Moment

central

peripheral

Net-proton results: All data show deviations below Poisson for $\kappa\sigma^2$ at all energies. Larger deviation at $\sqrt{s_{NN}} \sim 20$

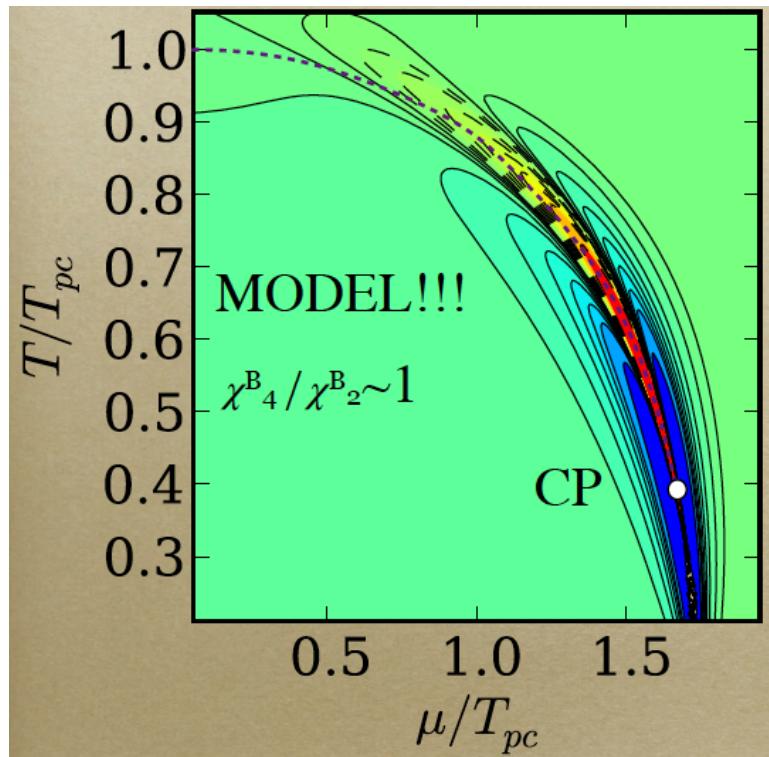

Non-monotonic behavior in central collision!

X.F. Luo, CPOD2014, QM2015

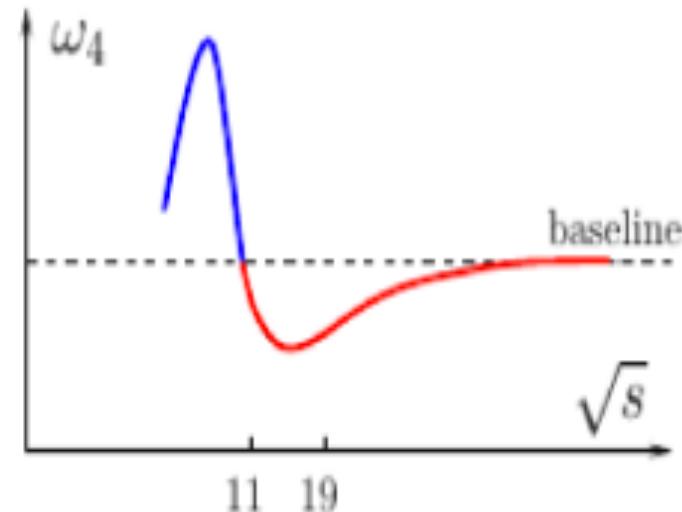

Question: What will happen at even lower collision energy?

Expectation from Calculations

V. Skokov, Quark Matter 2012

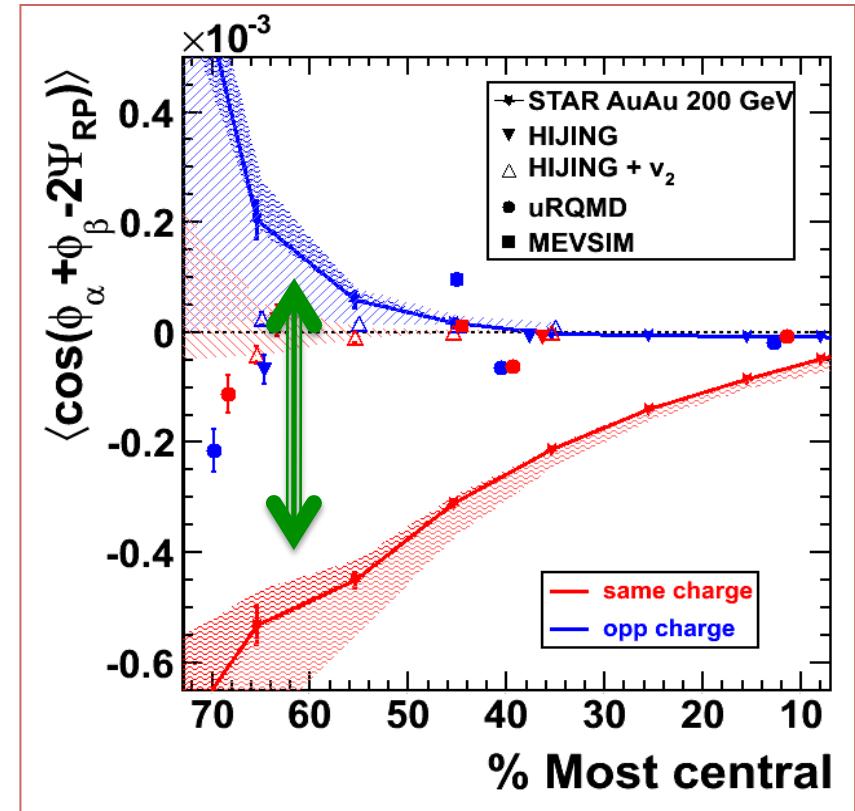

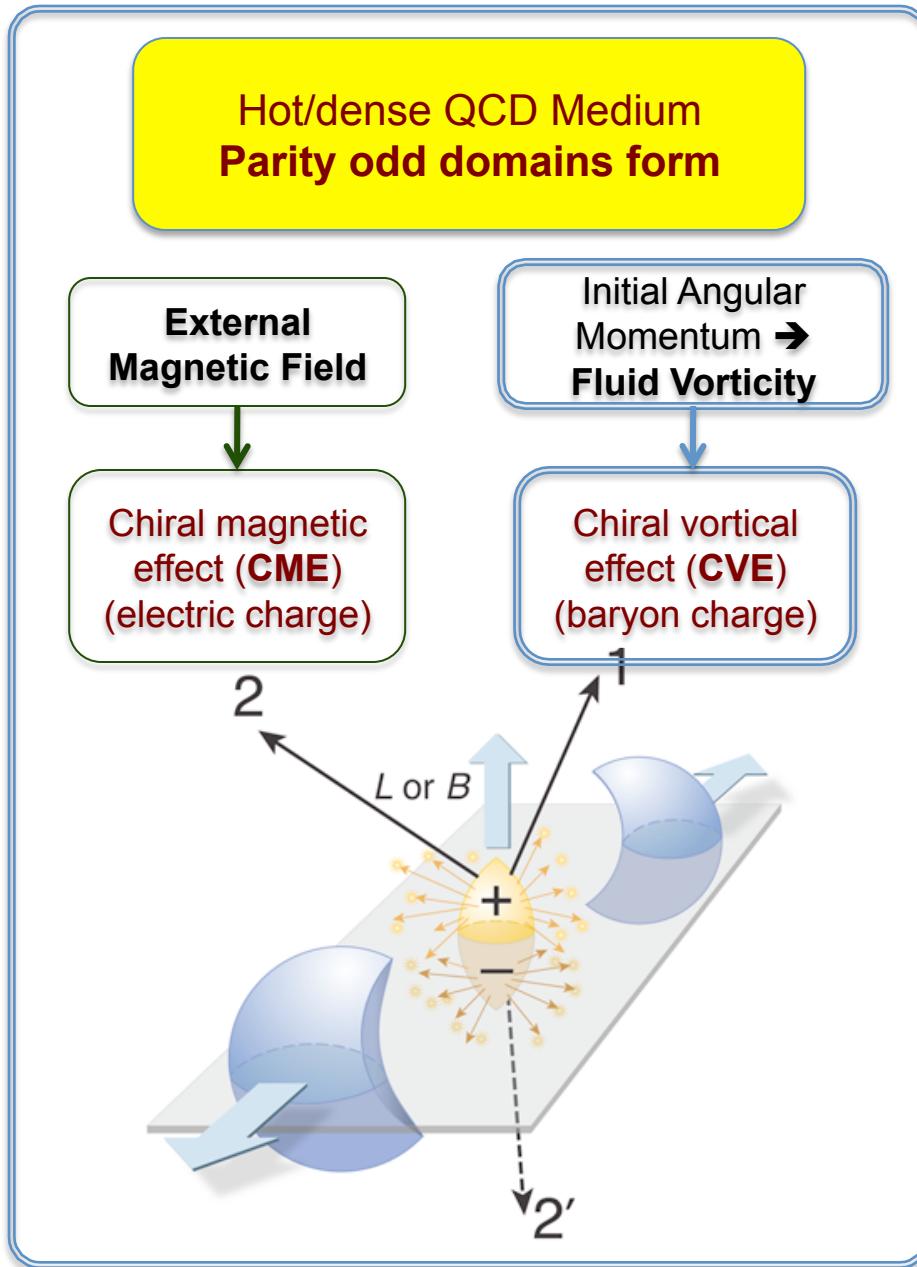

M. Stephanov, *PRL* 107, 052301(2011)

Characteristic “Oscillating pattern” is expected for CP.

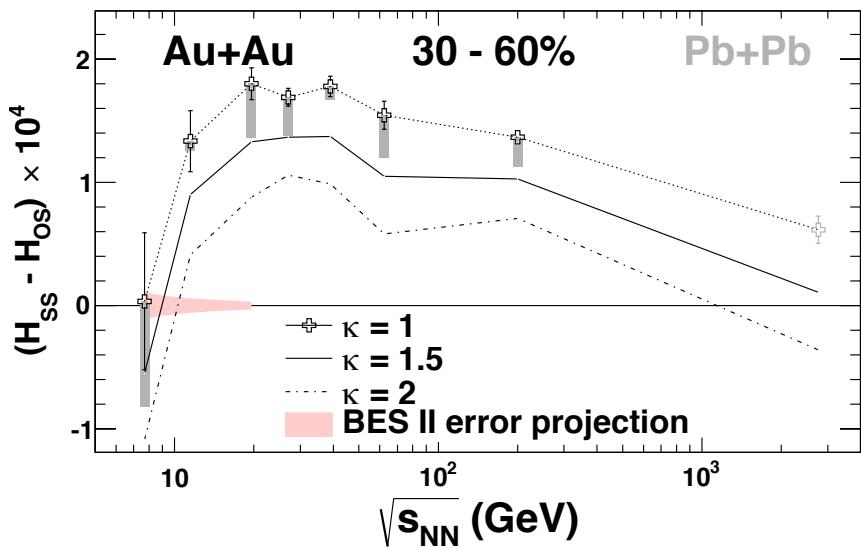

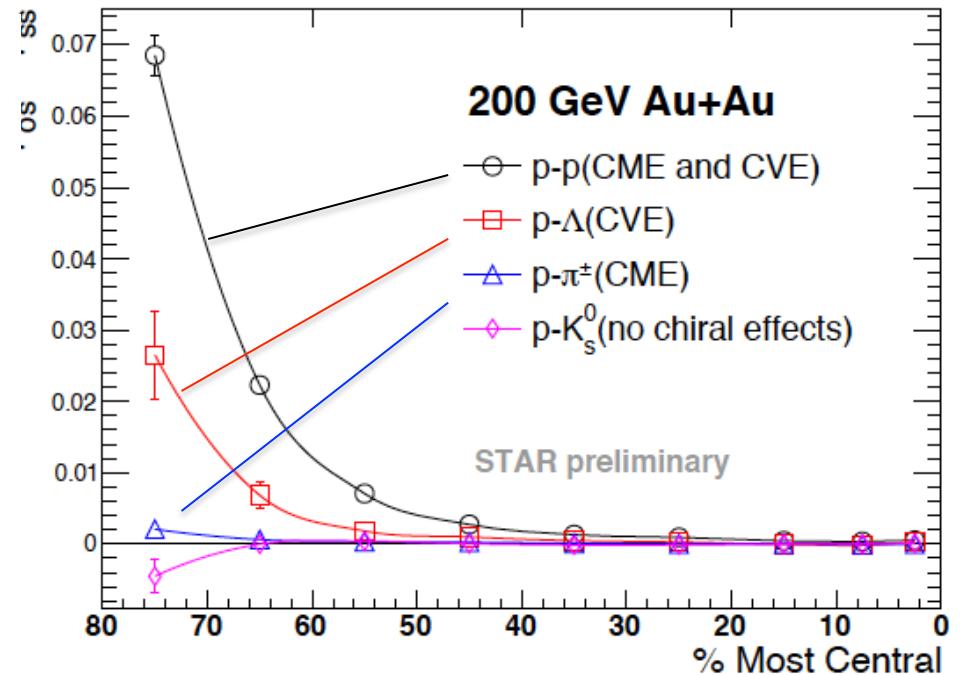

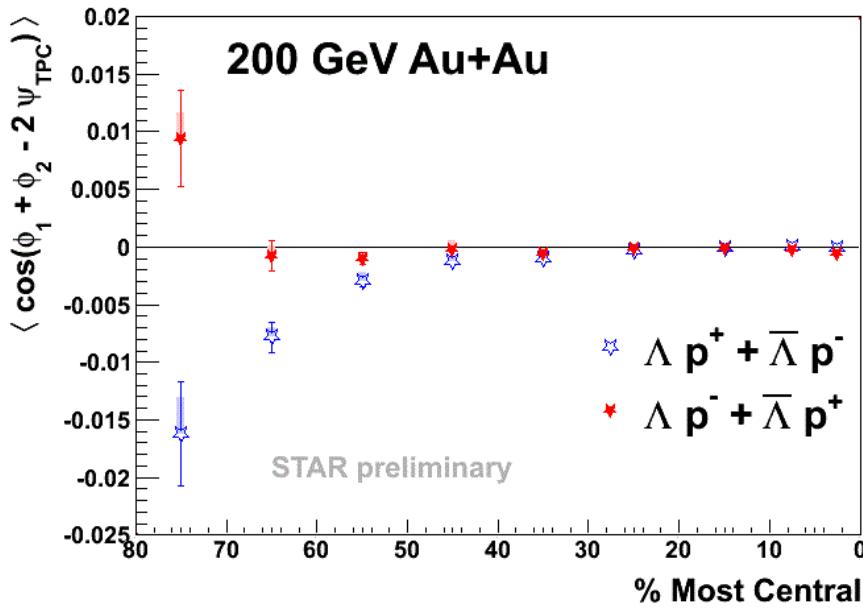

Study Chiral Effects (Global)

Charge pair correlation results are consistent with CME effect in non-central Au+Au collisions

- STAR: F. Zhao, NPA931, c746(14)
 PRL. 103, 251601(09) ; 113, 52302(14)
 D. Kharzeev, D.T. Son, PRL106, 062301(11)
 D. Kharzeev. PLB633, 260 (06)
 D. Kharzeev, et al. NPA803, 227(08)

Charge Separation wrt Event Plane

- 1) CVE
- 2) Global Chiral effect hierarchy:
- 3) LPV(CME) disappears at low energy:
→ hadronic interactions become dominant at $\sqrt{s_{NN}} \leq 11.5$ GeV

STAR: PRL. 103, 251601(09); 113, 52302(14)

The BES-II Program and Beyond

BES II Related Upgrades

1) RHIC Electron Cooling:

- Luminosity increase by factors of 3-10 for $5 < \sqrt{s}_{NN} < 20$ GeV

2) Inner TPC (iTPC):

- Extends rapidity coverage: $|y_p|$ from 0.5 to 0.8 →
Crucial for QCD CP study
- Improved tracking efficiency and dE/dx →
Important for di-electron measurements

3) Event Plane Detector (EPD):

- Extends pseudo-rapidity coverage to: $1.8 < |\eta| < 4.5$ →
Trigger and event selection: multiplicity, event-plane

4) End Cap TOF (eTOF) – (CBM-STAR):

- Extends PID to about $|\eta| < 1.5$ →
Fixed-target program $\mu_B = 700$ MeV

Event Statistics for BES II at RHIC

| \sqrt{s}_{NN} (GeV) | Events (10^6) | BES II / BES I | Weeks | μ_B (MeV) | T_{CH} (MeV) |
|--------------------------|-------------------|-----------------------|------------|------------------|-------------------|
| 200 | 350 | 2010 | | 25 | 166 |
| 62.4 | 67 | 2010 | | 73 | 165 |
| 39 | 39 | 2010 | | 112 | 164 |
| 27 | 70 | 2011 | | 156 | 162 |
| 19.6 | 400 / 36 | 2019-20 / 2011 | 3 | 206 | 160 |
| 14.5 | 300 / 20 | 2019-20 / 2014 | 2.5 | 264 | 156 |
| 11.5 | 230 / 12 | 2019-20 / 2010 | 5 | 315 | 152 |
| 9.2 | 160 / 0.3 | 2019-20 / 2008 | 9.5 | 355 | 140 |
| 7.7 | 100 / 4 | 2019-20 / 2010 | 14 | 420 | 140 |

Event statistics driven by QCD CP search and di-electron measurements

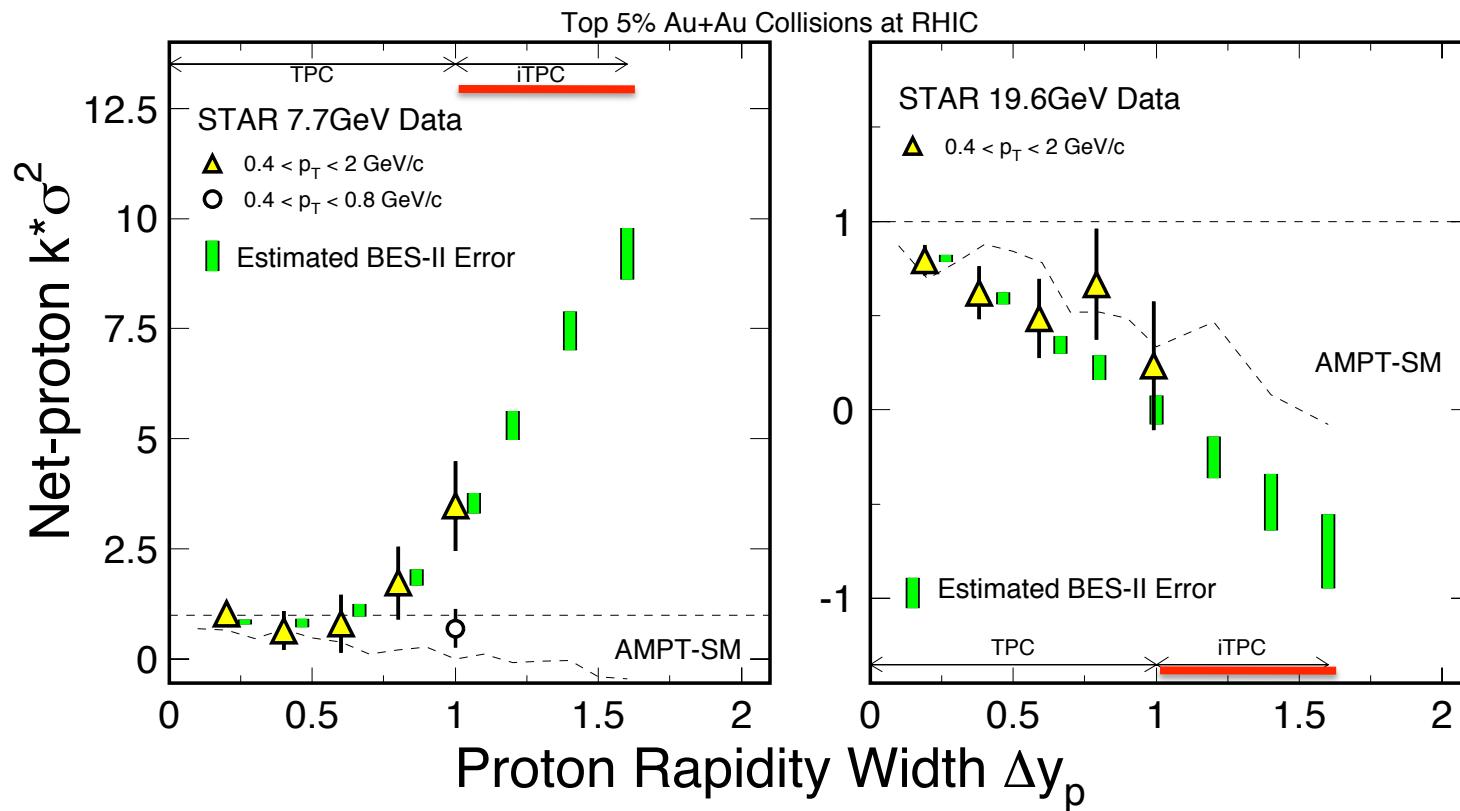

BES-II: Chiral Properties

High net-baryon region:

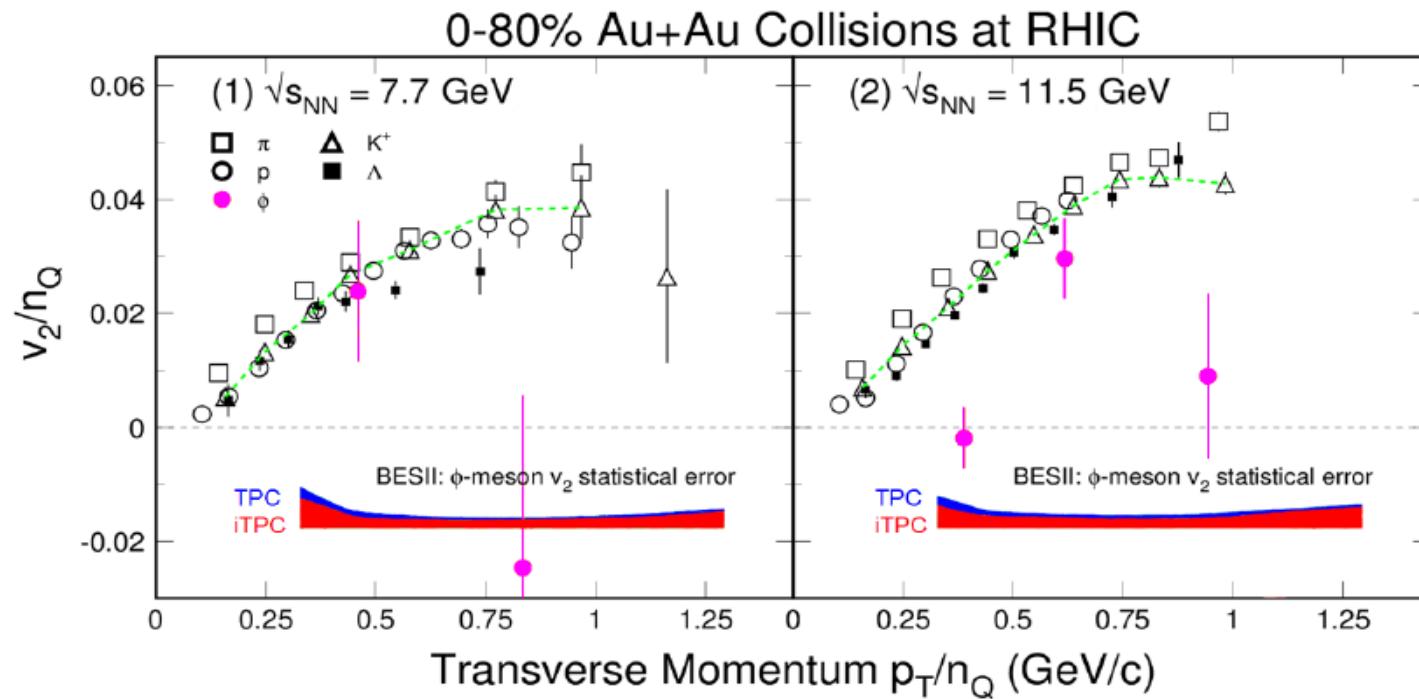

- 1) Precision measurements on di-electron distributions
- 2) Global Chiral properties with identified hadrons

BES-II: Critical Point

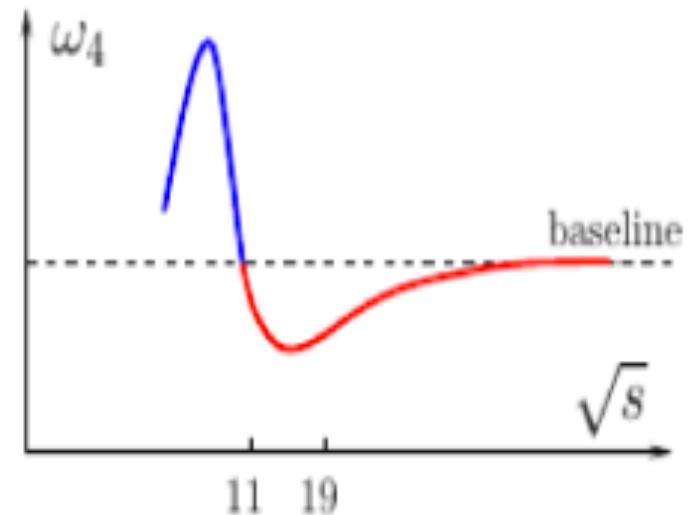

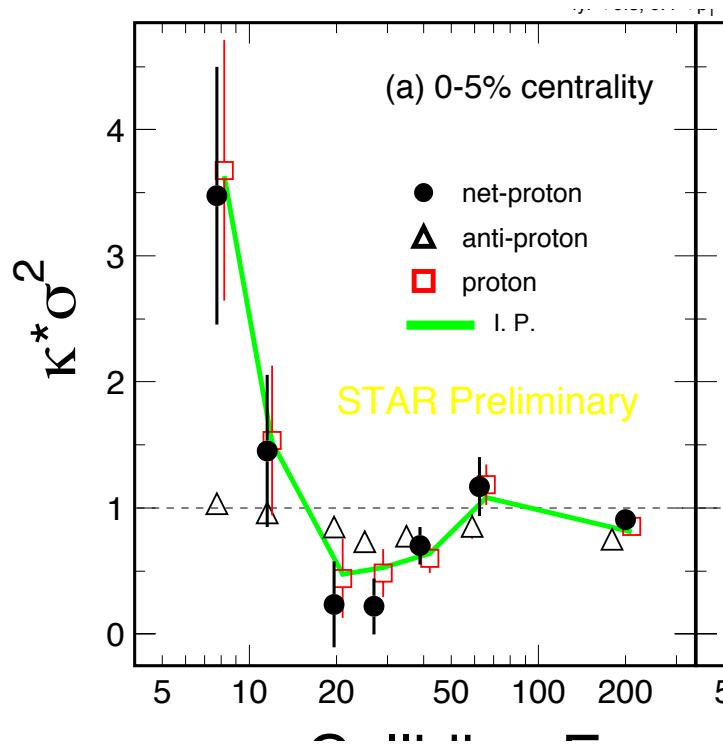

- 1) iTPC extend the rapidity coverage to $\Delta y = 1.6$, allowing to studying kinematic acceptance for the CP (CR) search
- 2) Precision measurement of net-proton higher moments at high net-baryon region

BES-II: Collectivity

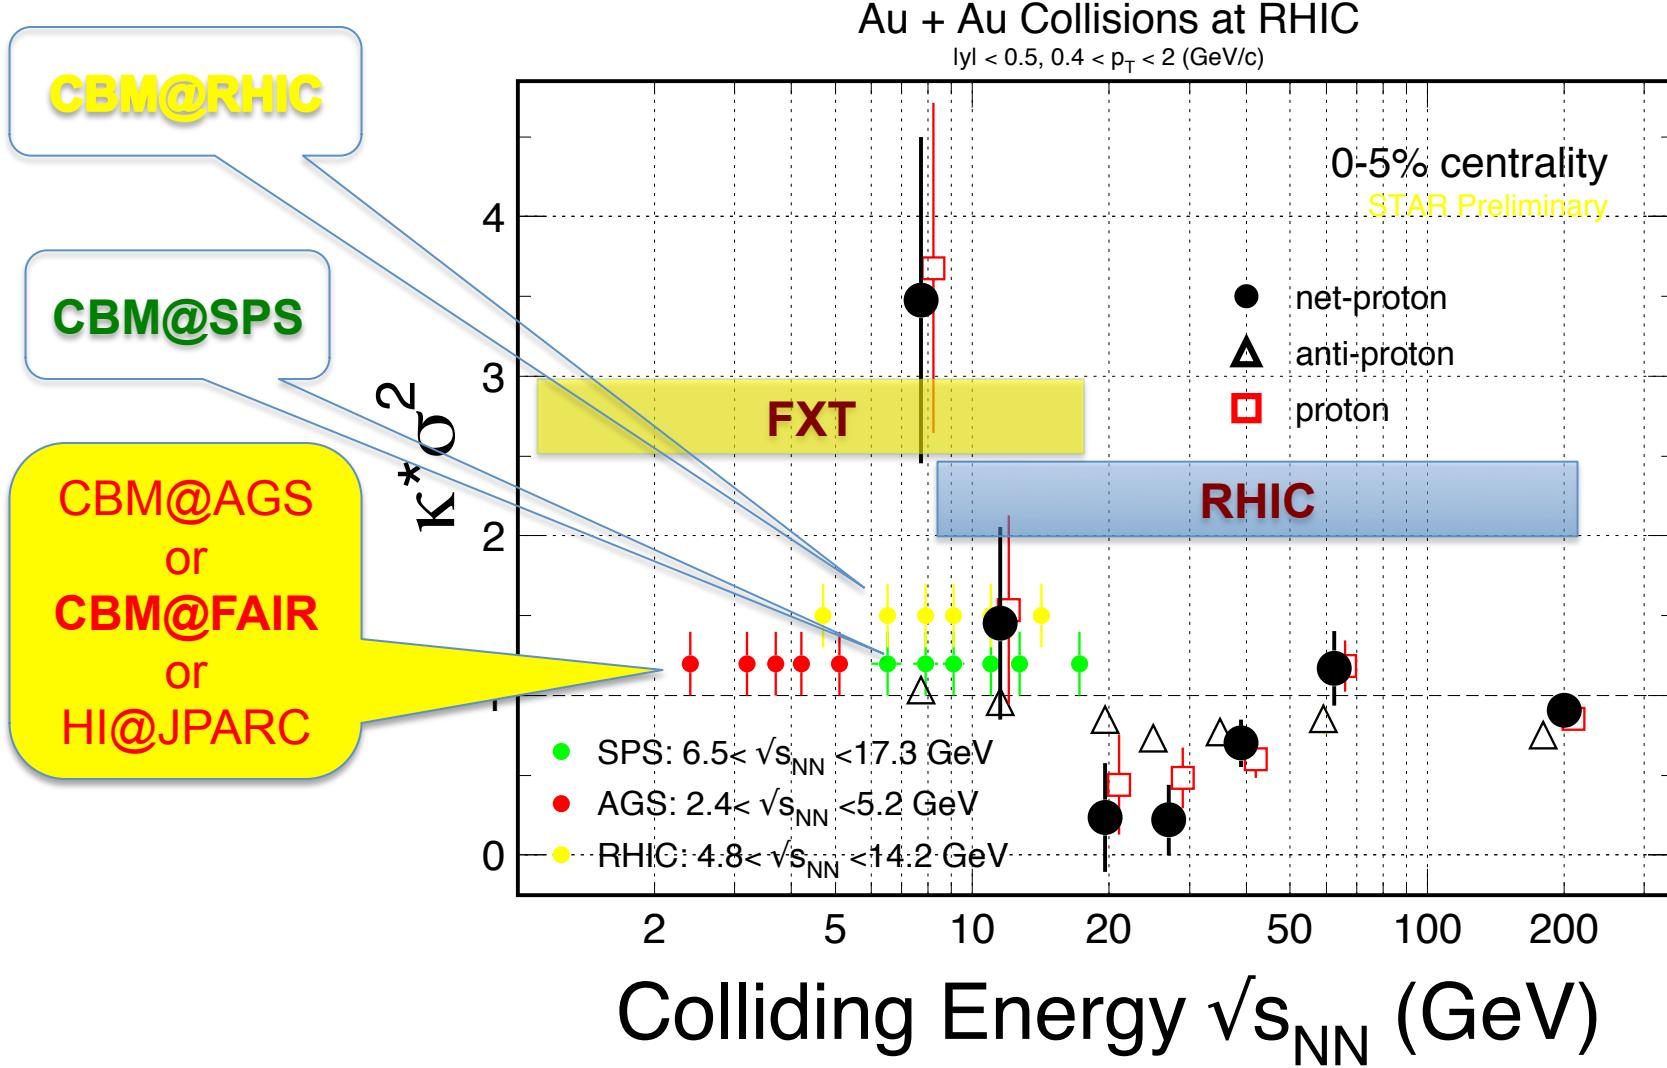

- 1) Precision measurement for ϕ -meson v_2 .
- 2) Study the partonic vs. hadronic interactions in the high net-baron region.

Net-proton Higher Moment

Question: What will happen at even lower collision energy, higher baryon density, region?

Fix-Target Experiments

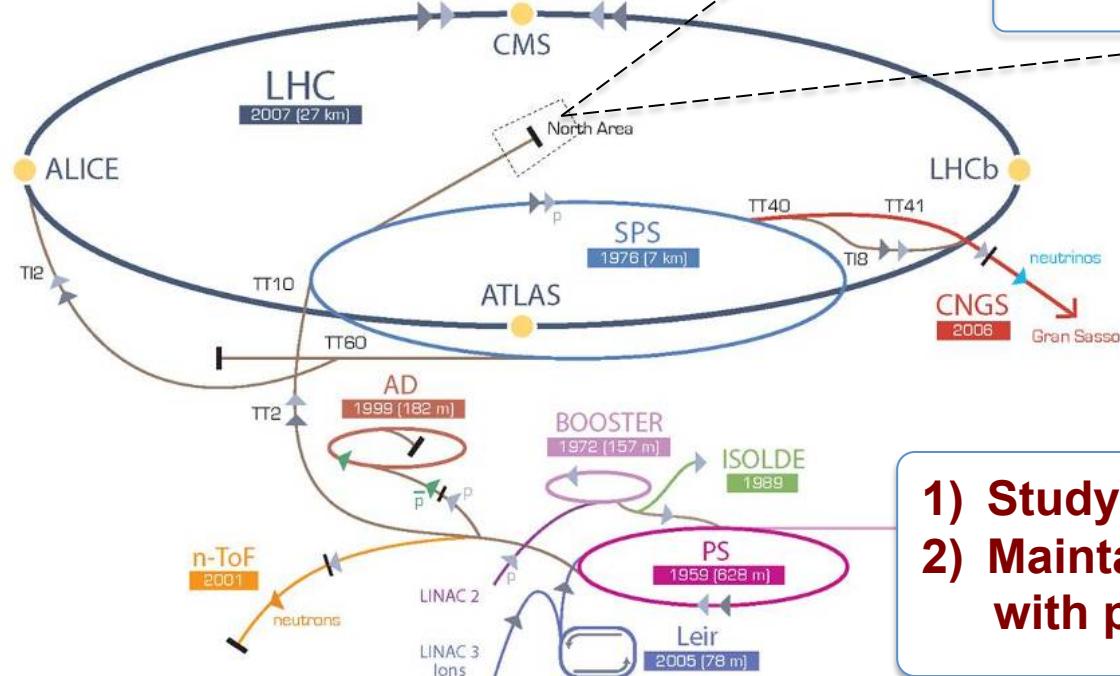

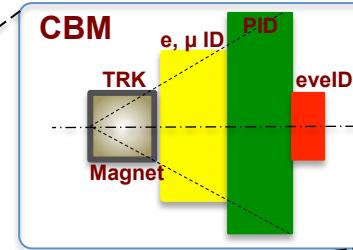

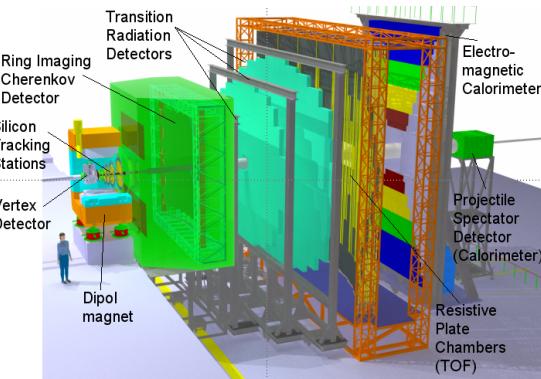

CBM@SPS

2019

CBM@SPS

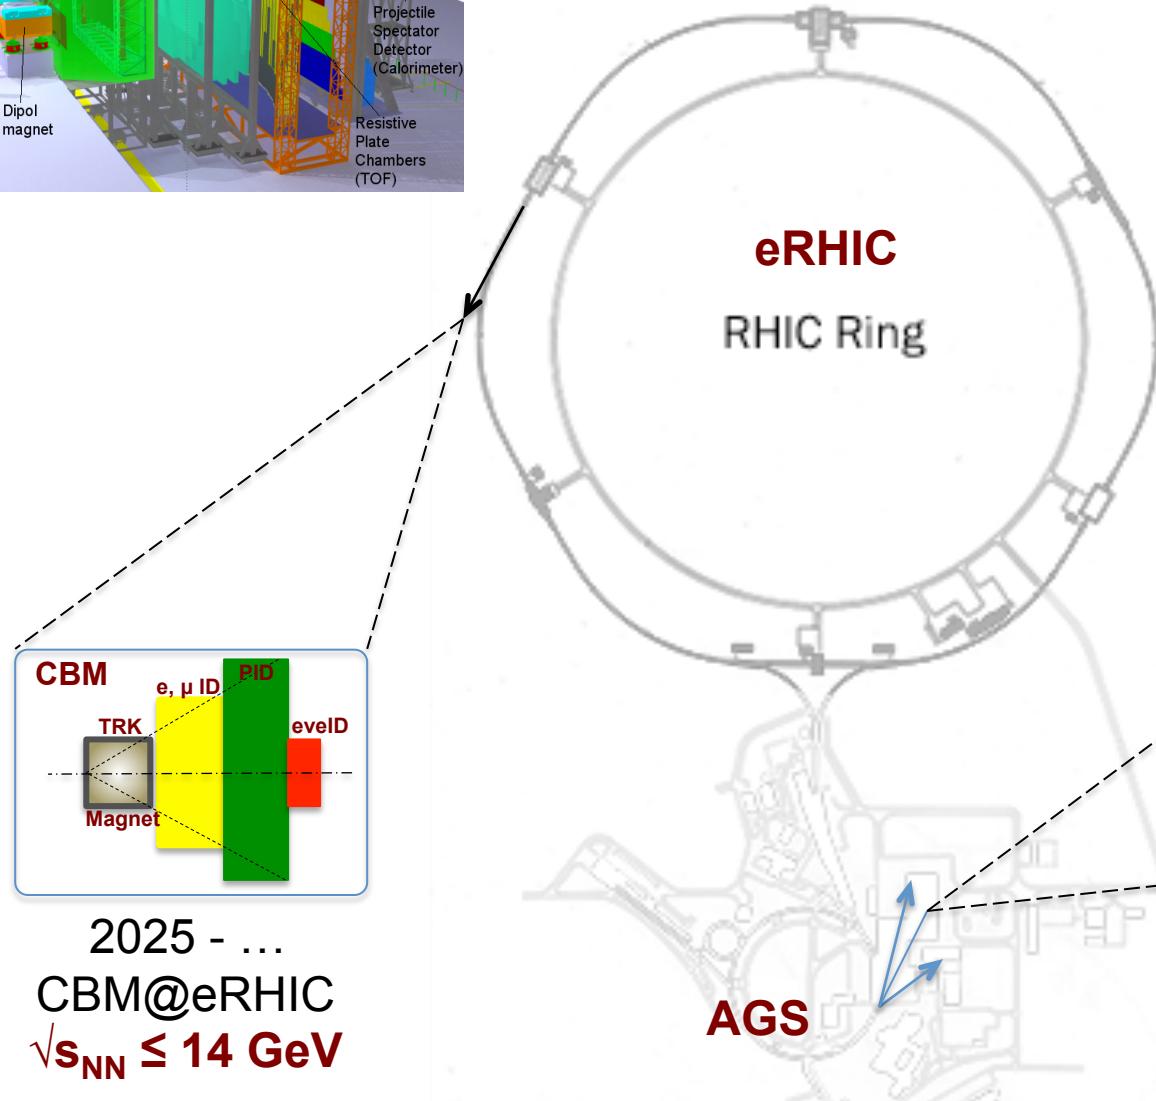

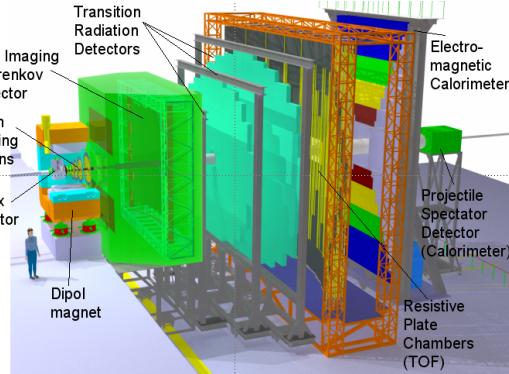

$6.5 \leq \sqrt{s_{NN}} \leq 17.2 \text{ GeV}$

- 1) Study QCD phase structure
- 2) Maintain heavy ion community with physics results

CBM@BNL

- 1) Study QCD phase structure
- 2) Maintain heavy ion community
- 3) CBM@eRHIC is an add on cost

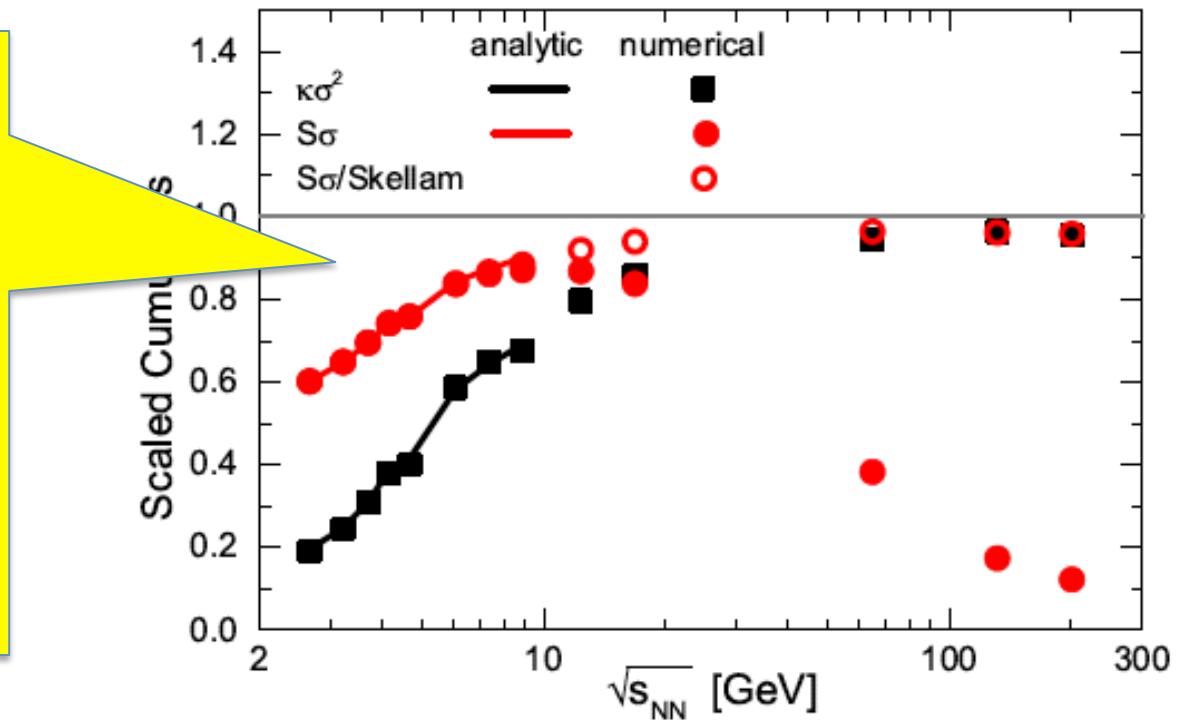

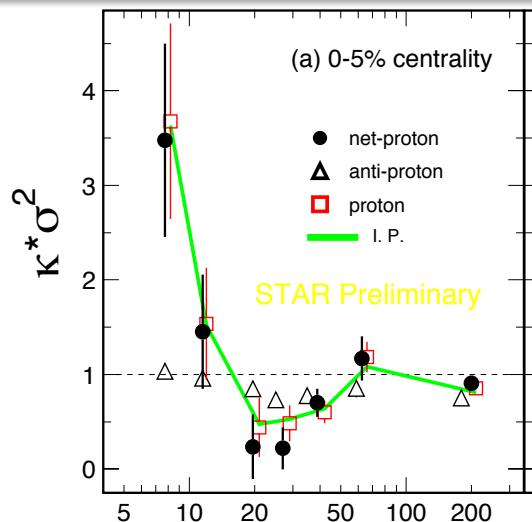

2020 - 2025
CBM@AGS
 $\sqrt{s_{NN}} \leq 5.4 \text{ GeV}$

Model Simulation Results

Z. Feckova, J. Steonheimer, B. Tomasik, M. Bleicher, 1510.05519, PRC92, 064908(15)

- Baryon conservations
- Deuteron productions suppress the higher order net-proton fluctuations, especially below $\sqrt{s_{NN}} \sim 10$ GeV

But, data is above the unity!

- 1) X.F. Luo *et al*, NP **A931**, 808(14)
- 2) P.K. Netrakanti *et al*. 1405.4617, accepted by NPA
- 3) P. Garg *et al*. Phys. Lett. **B726**, 691(13)

Challenges

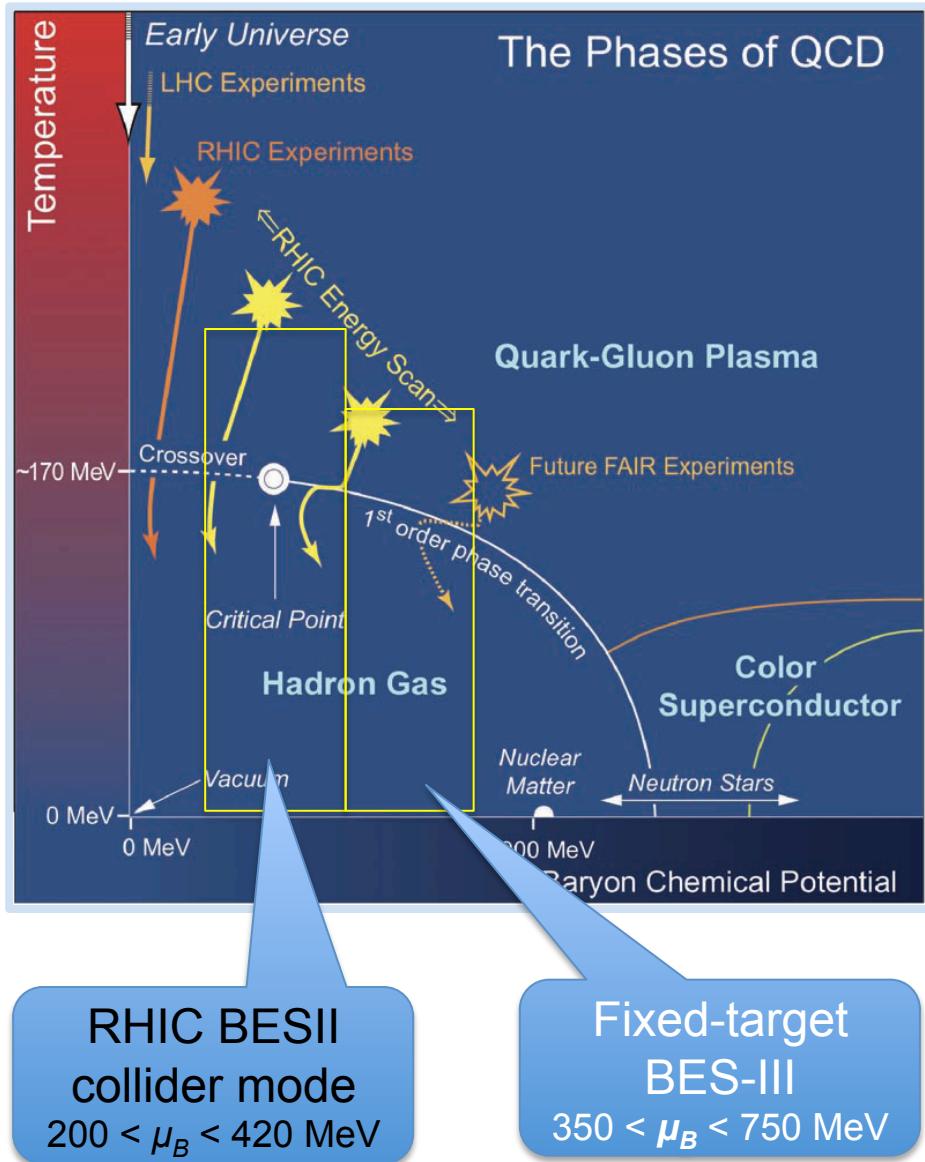

1) Experiment:

- Effects of acceptance
- Effects of efficiency, PID
- Collider vs. FXT

2) Theory:

- Chiral effect
- Criticality at finite baryon density in transport approach and LGT

Summary

RHIC e-cooling and iTPC upgrades bring BES-II a **new era** for studying the QCD phase structure at high net-baryon region ($200 < \mu_B < 420$ MeV) with unprecedented precision and coverage. Possible new discoveries are:

- 1) **Partial** QCD critical point (region)
- 2) Properties with Chiral symmetry
- 3) ϕ -meson v_2

Longer Future: fixed-target experiment at extreme large net-baryon density, $350 < \mu_B < 750$ MeV
($8 < \sqrt{s_{NN}} < 2$ GeV)

FXT program **BES-III** needed for
QCD Critical Point!
