### 3 Properties of low-lying levels in the isotopes from $Z = 21$ to $Z = 36$

#### 3.1 Introduction

In this chapter experimentally established properties of levels in nuclei with mass number  $Z$  from 21 to 36 are presented. The nuclei are ordered, firstly, by the  $Z$ -number and, secondly, by the atomic mass number  $A$  within isotopic chains from lesser to larger values. Only the levels with well-established values of angular momentum  $J$  and parity  $\pi$  are included in this compilation. All stable and unstable (with a half-life time of more than one minute) nuclei are presented. Exceptions are isotopes with a half-life time of a few minutes in which only one or two excited levels in accordance with the selection procedure are known. The information on level properties is adapted from the Nuclear Data Sheets and the data base at the National Nuclear Data Center, Brookhaven National Laboratory.

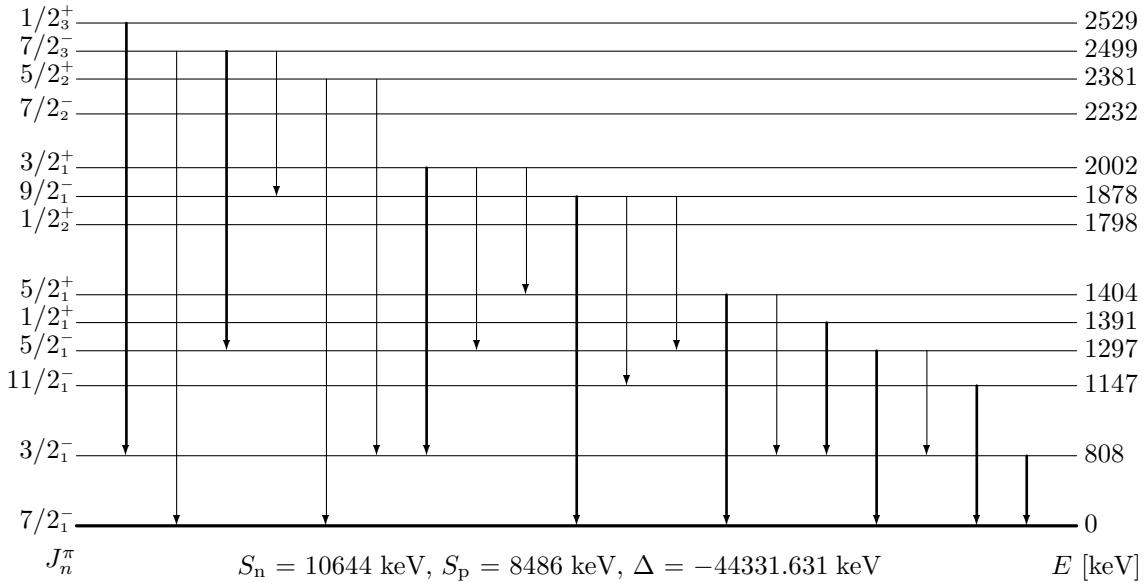

##### 3.1.1 Description of the level schemes

An example of the level scheme is shown in Fig. 3.1. Levels are plotted by horizontal lines, the thick line corresponds to the nuclear ground state. At the left-hand side of the figures information on the total angular momentum  $J$  and parity  $\pi$  of the levels is provided as  $J_n^\pi$ . The index  $n = 1, 2, \dots$  indicates whether the state  $J^\pi$  is the first, second, etc., in the total energy spectrum. The excitation energies of the levels relative to the ground state are given in keV at the right-hand side of the figures. The decay of levels by  $\gamma$ -transitions is shown by vertical lines. For each level the transition which has the largest intensity is plotted by a thick line. If a level decays into only one other level, it is also specified by a thick line. At the bottom of each level scheme the values of neutron,  $S_n$ , and proton,  $S_p$ , separation energies and of mass excess  $\Delta$  in keV are provided for the ground state.

In a few exceptional cases it was not possible to represent all known levels in the figure for technical reasons. Then the figure is cut at high energies. The information on truncated levels is provided in the table.

##### 3.1.2 Description of the tables

The tables contain basic information on nuclei levels, their population and decay properties. In the first and second columns of the tables the  $J_n^\pi$  quantum numbers and excitation energies (in keV) of the levels are presented, respectively. There is one-to-one correspondence to the same quantities on the left-hand side and right-hand side of the figures. The half-life time of levels,  $T_{1/2}$ , is given

Figure 3.1: Part of the level scheme for  $^{47}\text{Sc}$ .

in the third column. The following conventional units are used: y = year, d = day, h = hour, m = minute, s = second, ms =  $10^{-3}$  s,  $\mu\text{s}$  =  $10^{-6}$  s, ns =  $10^{-9}$  s, ps =  $10^{-12}$  s, fs =  $10^{-15}$  s. For levels above the particle threshold the width of levels in eV is given.

Other information on properties of the levels is collected in the last column of the tables. The following information is provided:

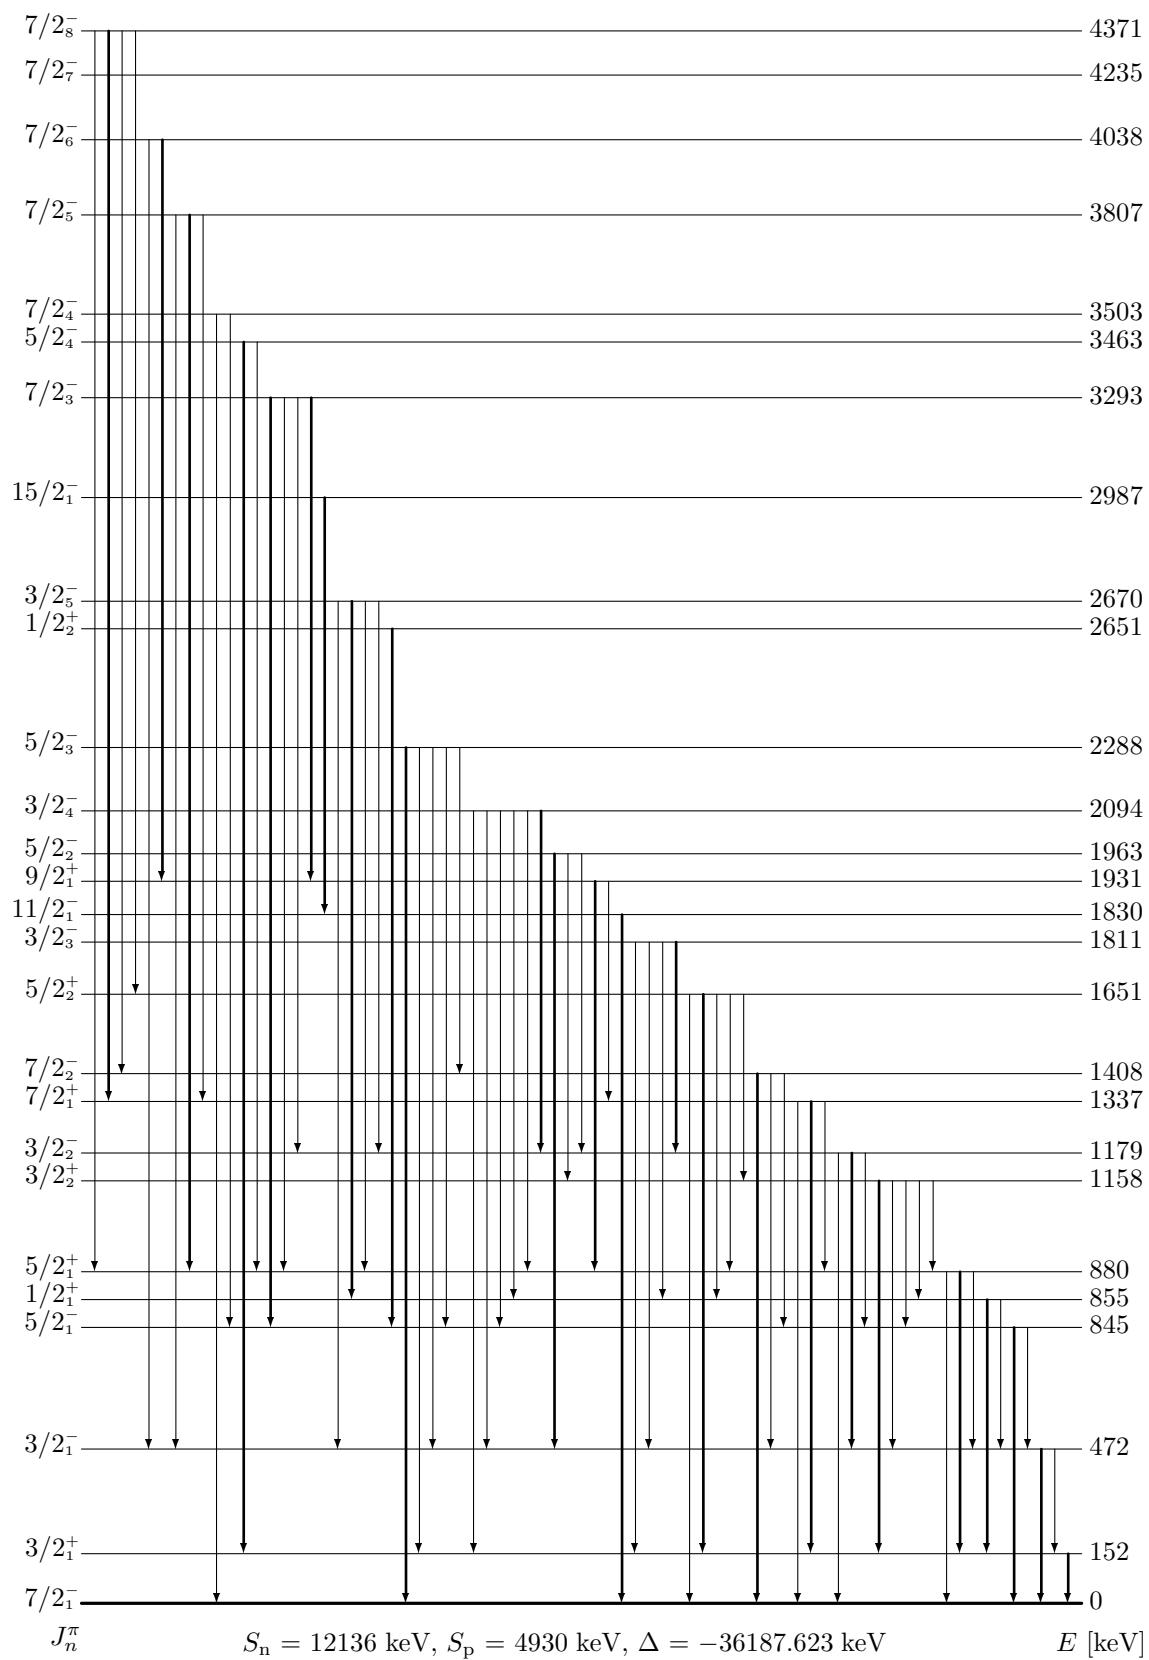

- 1) quadrupole,  $Q$ , (in barn) and magnetic,  $\mu$ , (in nuclear magnetons,  $\mu_n$ ) moments of the ground state and excited levels;
- 2) log  $ft$  values for  $\beta^-$  ( $\beta^-$ ) decays or  $\beta^+$  and electron capture decays ( $\beta^+$ ). In brackets the quantum numbers  $J^\pi$  of the level in neighboring nuclei,  $(A, Z-1)$  or  $(A, Z+1)$ , respectively, from which the decay takes place are specified;
- 3) reduced transition probabilities  $B(E\lambda \rightarrow J_n^\pi)$  or  $B(M\lambda \rightarrow J_n^\pi)$  for  $\gamma$ -decay of the level into levels at lower energies with quantum numbers  $J_n^\pi$ . They are given in Weisskopf units (W.u.):

$$B(E\lambda)_{\text{W.u.}} = \frac{1}{4\pi} \left( \frac{3}{\lambda + 3} \right)^2 (1.2 \cdot A^{1/3})^{2\lambda} \quad \text{e}^2 \text{ fm}^{2\lambda} ,$$

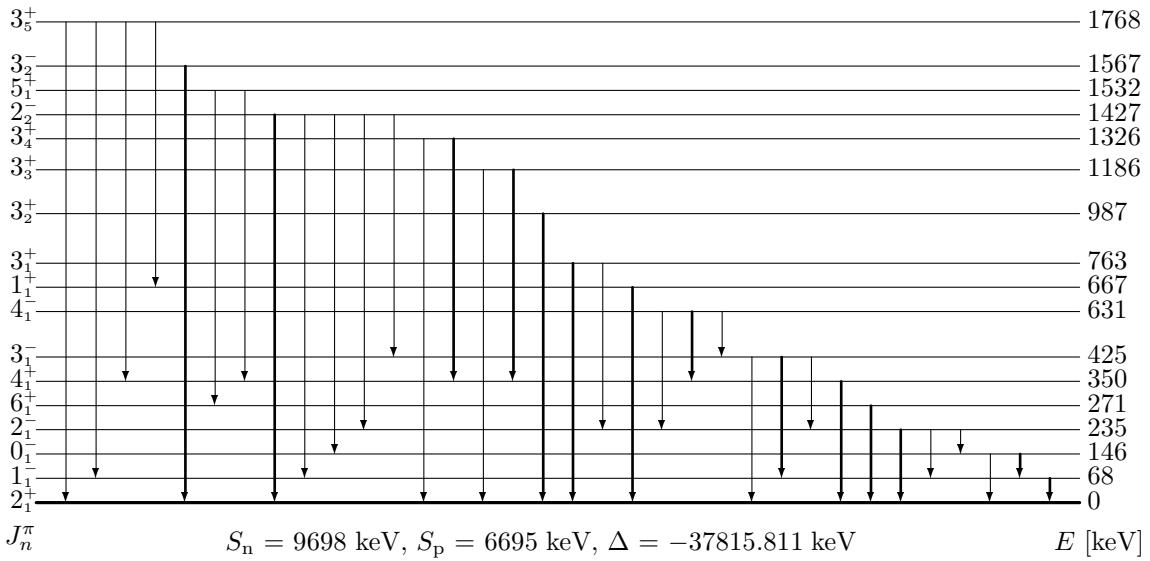

$$B(M\lambda)_{\text{W.u.}} = \frac{10}{\pi} \left( \frac{3}{\lambda + 3} \right)^2 (1.2 \cdot A^{1/3})^{2\lambda-2} \quad \mu_n^2 \text{ fm}^{2\lambda-2} .$$

$B(M1/E2 \rightarrow J_n^\pi)$  means that the decay to the  $J_n^\pi$  level occurs by M1 and E2 transitions. For such cases the mixing ratio,  $\delta$ , is given in brackets if known;

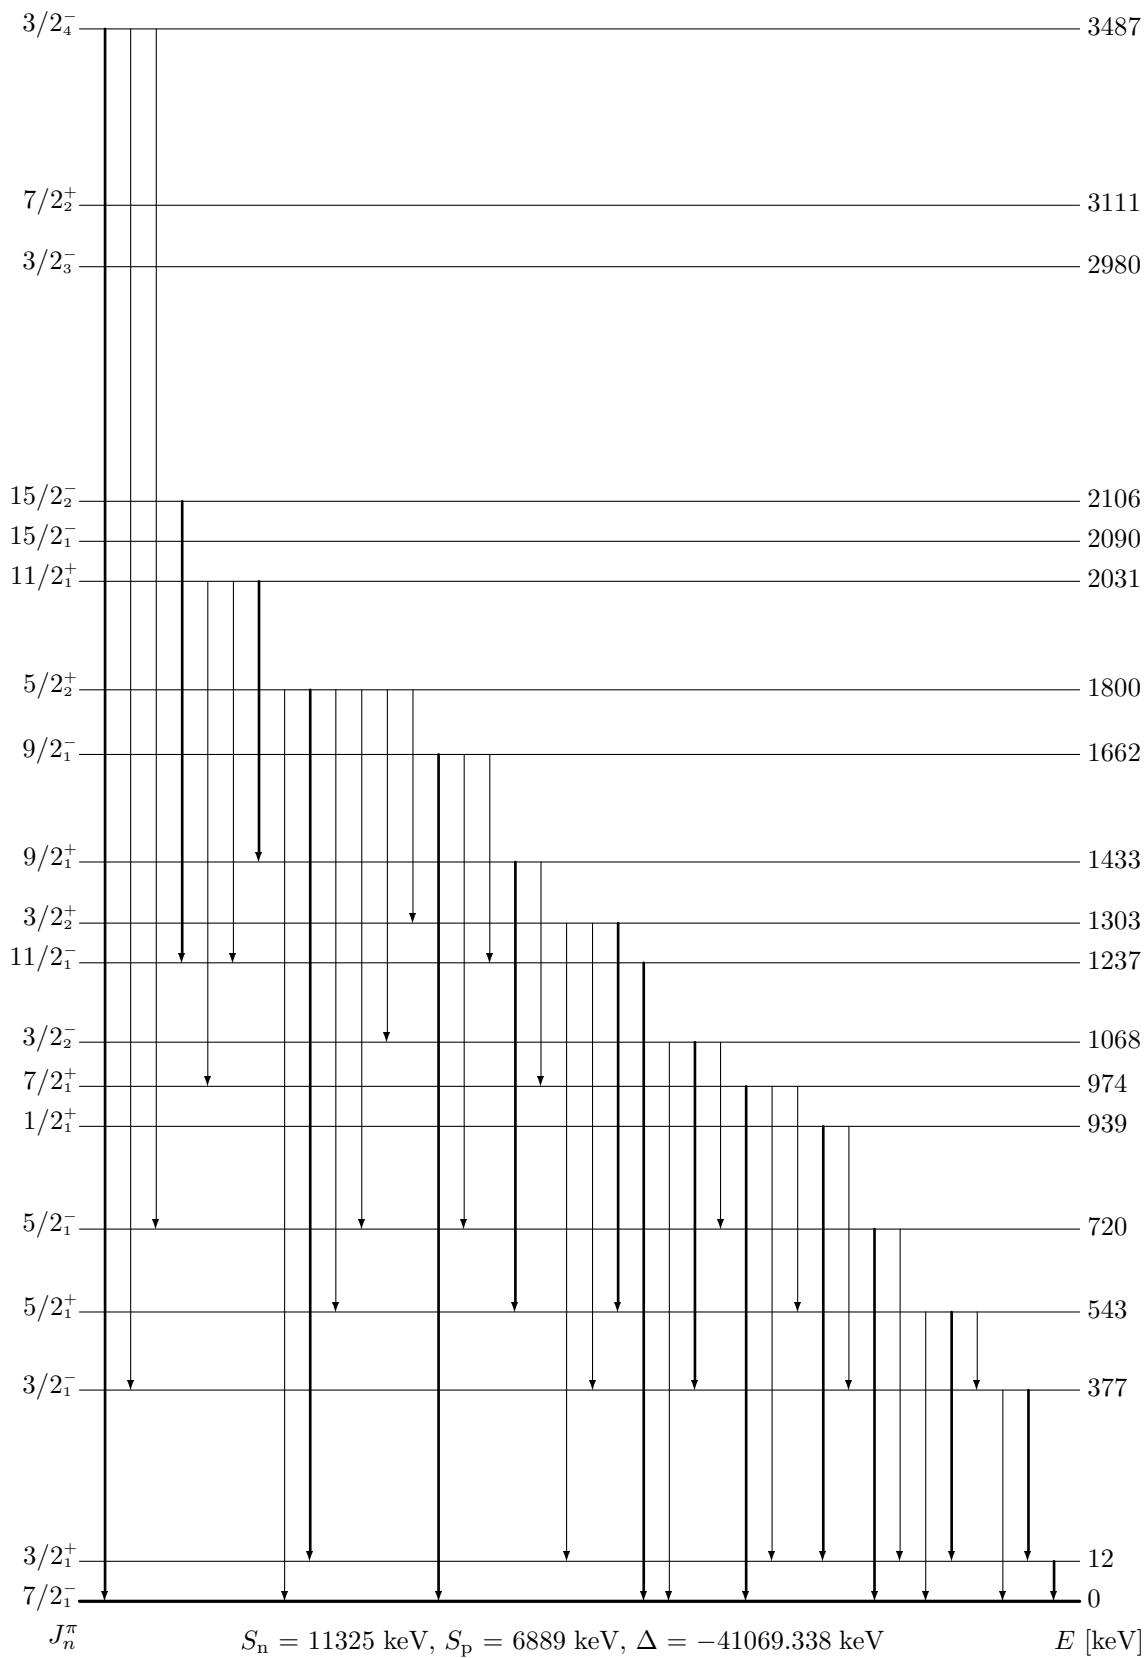

- 4) main nuclear reactions in which the level have been populated. These are: a) Coulomb excitation (Coul. ex.); b) inelastic scattering of  $\gamma$ 's, electrons, protons, deuterons and  $\alpha$ -particles; c) one-nucleon transfer reactions; d) two-nucleon transfer reactions. If the log  $ft$  value is given for the level, it means that it is also populated in  $\beta^+$  or  $\beta^-$  decays, respectively, or in both.
